

	Thioamides		Iodide
E.g.	Methimazole (Preferred)	Propylthiouracil	-Potassium iodide (KI) -Lugol's solution
MOA	Inhibit peroxidase enzyme → inhibit iodination and oxidative coupling → <b>block synthesis of T4 &amp; T3</b>		<ul style="list-style-type: none"> <li>↓ Iodination of thyroglobulin (Acute <b>Wolff-Chaikoff Effect</b>)</li> <li>↓ T4/T3 release → <b>main effect</b></li> <li>🕒 <b>Rapid symptom relief</b> → in <b>2–7 days</b></li> <li>🕒 <b>Short-lived</b> → gland escapes inhibition after few weeks</li> </ul>
	---	inhibits the <b>peripheral conversion</b> of T4 to T3.	
Uses	<b>Use in pregnancy</b>		<b>Short term therapy:</b> <ul style="list-style-type: none"> <li><b>Thyroid storm</b></li> <li><b>Pre-op</b> (7–14 days) → ↓ size + vascularity of thyroid</li> <li>☢️ <b>Post-RAI</b> → KI for 3–7 days</li> </ul>
	Cause birth defects	<b>Drug of choice in pregnancy</b>	
	<b>Indications</b>		
	-Induce <b>remission in Graves' disease</b> - <b>Preoperative</b> → Before surgery ( <b>to prevent thyroid storm</b> ) and RAI treatment		
S/E	<b>Hepatotoxicity (Liver failure) &amp; Leukopenia</b>		<ol style="list-style-type: none"> <li><b>Hypersensitivity:</b> skin rash, etc.</li> <li><b>Iodism:</b> salivary/lacrimal swelling, sore gums/teeth</li> <li><b>Metallic taste</b></li> <li><b>Mucosal ulcers</b></li> </ol>
	Low risk	High risk	
	📄 <b>Monitor</b> Liver functions × first 6 months		
	<b>Other</b>		
	<ol style="list-style-type: none"> <li><b>Rash + Arthralgia + Fever</b> → in ≤5% of patients</li> <li><b>Lupus-like syndrome / Hepatitis / GIT distress</b> → less common</li> <li><b>Mild ↓ WBCs</b></li> <li><b>Severe agranulocytosis (BM Depression) (Rare &amp; Fatal):</b> Granulocyte count &lt;250/μL           <ul style="list-style-type: none"> <li>🔄 <b>Reversible</b> → Stop drug</li> <li>🔴 <b>PTU &gt; Methimazole</b></li> <li>🕒 <b>Onset:</b> within first 3 months</li> <li>📄 <b>Monitor:</b> CBC</li> <li>🔴 <b>Contact doctor:</b> Experiencing fever, malaise, sore throat, flu-like symptoms</li> </ul> </li> </ol>		
Pharmacodynamic	<b>Efficacy</b>		---
	More effective	Less effective	
	<b>T½</b>		
	<b>Longer</b> (8 hrs) → Once daily	<b>Short</b> (2 hrs) → 2-3 times a day	
	<b>Plasma Protein binding</b>		
	Not bound → crosses placenta and appears in breast milk	80% bound	
Effects	🕒 <b>Delayed onset</b> → takes 4–8 weeks		---
	⬆️ <b>Start with high dose</b> → once euthyroid → taper ↓ monthly to maintenance		
	📅 <b>Treatment duration:</b> 12–24 months		
	✅ <b>~45%</b> achieve permanent remission		

### β-Blockers in Hyperthyroidism

- **Hyperthyroid effect on Sympathetic NS:** ↑ β-receptor density → leads to sympathetic overactivity
- **Mechanism of β-blockers (Atenolol, Propranolol):** ↓ CVS symptoms
  - **Propranolol:** also ↓ peripheral conversion T4 → T3
  - **When contraindicated** → use CCBs like diltiazem

Radioactive iodine ( <sup>131</sup> I) (RAI)	
MOA	<ul style="list-style-type: none"> <li>Colorless, tasteless, oral route</li> <li> <b>Rapid GI absorption</b> → selectively taken up by thyroid</li> <li> <b>Emits low-penetration radiation</b> → destroys thyroid tissue</li> <li> T4/T3 normalize over 4–8 weeks</li> </ul>
Adjunctive therapy	<p><b>1. Thioamides</b></p> <ul style="list-style-type: none"> <li> Stop 3–7 days before RAI</li> <li> Restart 3–7 days after</li> </ul> <p><b>2. β-Blockers</b></p> <ul style="list-style-type: none"> <li> Continue to control symptoms until RAI takes full effect</li> </ul> <p><b>3. Iodide salts (KI)</b></p> <ul style="list-style-type: none"> <li> <b>Do NOT give before RAI</b> → competes with I<sup>131</sup> uptake</li> <li> <b>Use AFTER RAI</b> → ↓ thyroid hormone release</li> </ul>
SE	80–90% → <b>hypothyroid post-RAI</b> → Require lifelong levothyroxine
CI	<ul style="list-style-type: none"> <li><b>Pregnancy</b> → Not teratogenic if pregnancy occurs after TTT</li> <li>Young children, Thyroid cancer, Uncontrolled heart disease</li> <li>Moderate to severe <b>Graves' ophthalmopathy</b></li> </ul>

	Levothyroxine (T4)	Liothyronine (T3)
Nature	<ul style="list-style-type: none"> <li>Synthetic T4</li> <li>Drug of choice (↓Potent)</li> </ul>	Synthetic T3
MOA	T4 = <b>major circulating form</b> → converted in tissues to T3 (active form) by <b>deiodinase</b>	T3 → binds to nuclear thyroid receptors (TRs) → <b>regulates gene transcription</b> for key metabolic processes
Relative Potency	1	4
T <sub>1/2</sub>	8 days	1 day
Dose	Once daily	1-3 times/day

**Levothyroxine (T4)**

⚠ ↓ Absorption with: Coffee, Ca<sup>2+</sup>, Al<sup>3+</sup>-antacid (Take on **empty stomach**)

- Monitor response after 6–8 weeks** → assess clinical status + **↓ TSH**
- Start low dose in:** Elderly & Severe/long-standing hypothyroidism → Gradually increase to avoid CVS stress

**Drugs causing hypothyroidism:** Lithium and Amiodarone (anti-arrhythmic)

## Surgical Treatment of Hyperthyroidism

### Features

- Subtotal or total thyroidectomy
- Least favored therapy

### TTT of choice in

- Very large gland causing Pressure symptoms
- Large multi-nodular glands
- Females who desire Pregnancy within the next year
- Thyroid cancer
- Moderate to severe Graves' ophthalmopathy

### S/E

- Hypo**thyroidism
- Hypo**parathyroidism (Transient/Permanent)
- Recurrent laryngeal nerve paralysis

	Severe hyperthyroidism (Thyroid storm)	Severe hypothyroidism (Myxedema coma)
<b>Def</b>	An acute, life-threatening complication of hyperthyroidism.	Metabolic decompensation & mental status change
<b>Mortality</b>	---	<b>high mortality rate</b> despite treatment
<b>Management</b>	<p><b>1. Inhibition of hormone synthesis:</b></p> <ul style="list-style-type: none"> <li>○ <b>PTU: High dose</b> → then lower dose and 4 times daily</li> <li>○ <b>Preferred over methimazole</b> → also inhibits peripheral conversion</li> </ul> <p><b>2. Inhibition of hormone release:</b></p> <ul style="list-style-type: none"> <li>○ <b>KI</b> → give ≥ 1 hr after Thioamide to prevent new hormone synthesis</li> </ul> <p><b>3. Inhibition of Peripheral conversion:</b> IV corticosteroids</p> <p><b>4. Control of CV effects:</b></p> <ul style="list-style-type: none"> <li>○ Propranolol (oral/IV)</li> <li>○ Metoprolol (cardio-selective)</li> <li>○ Diltiazem (if β-blockers are CI)</li> </ul> <p><b>5. Fluid replacement</b></p> <p><b>6. Treatment of the cause</b></p> <p><b>7. Manage hyperthermia</b></p> <ul style="list-style-type: none"> <li>○  Cooling blankets / acetaminophen</li> <li>○  Avoid aspirin (↑ displacement of the drug → ↑ free T4/T3)</li> </ul>	<p><b>1. Levothyroxine IV</b>  <b>High Loading dose:</b> 500–800 µg  <b>Maintenance dose:</b> 100 µg/day</p> <p><b>2. Hydrocortisone</b> 100 mg IV 3 times/day</p> <p><b>3. Fluid replacement</b></p> <p><b>4. Treatment of the cause</b></p> <p><b>5. Supportive care</b></p> <ul style="list-style-type: none"> <li>○ Respiratory support</li> <li>○ Hypothermia → warming blankets</li> </ul>
