

		Naegleria fowleri (Brain-eating amoeba)	Acanthamoeba castellani
Life cycle	Habitat	-Free living in soil and fresh- stagnant water -In human host (CNS)	- <b>Trophozoite and cyst may exist in environment and tissue</b> -Free living in soil, stagnant water and dust -In Human host (Brain, eye, skin, lung)
	Infective stage	<b>Amoeboid trophozoite</b>	<b>Trophozoite &amp; Cyst</b>
	Method & Source of infection	<b>Through Nasal route:</b> 1- Swimming in /or sniffing contaminated water. 2- Inhalation of contaminated air.	<b>Source of infection:</b> dust, stagnant water and contact lens fluid. <b>Mode of infection:</b> -Skin, Lungs and Cornea ( <b>contaminated contact lenses</b> )
Morphology	Trophozoite	<b>Amoeboid Trophozoite (tissues/CSF)</b> -Broad anterior end, tapering posterior end <b>-Single pseudopodium</b> <b>Flagellate Trophozoite (when contact with water)</b> -Pear shaped -2 long equal flagellae	-Amoeboid  -Cytoplasm is well differentiated  -Pseudopodia are <b>multiple</b> and <b>spiky</b> (Acanthopodia).
	Cyst	<b>-Only in soil (never in tissues)</b> -Rounded	-Double wall -Rounded
Pathology & Clinical picture		<b>Primary Amoebic Meningoencephalitis (PAM)</b> - <b>Neurotropic trophozoite</b> → Necrosis, bleeding, acute meningoencephalitis - <b>Subarachnoid space:</b> Inflammatory exudate - <b>Grey matter:</b> hemorrhage, inflammation, trophozoites, necrosis - <b>White matter:</b> demyelination (Due to phospholytic enzyme)  <b>Clinical picture</b> death in 3-6 days. <b>Prodromal (Stage I):</b> Severe frontal headache, fever, blocked nose, nausea & vomiting. <b>Meningeal irritation (Stage II) (Rapid progression)</b> -Neck stiffness (Kernig's sign), Fever, photophobia, <b>signs of ↑ ICP.</b> <b>Rapid progression</b> → Irritability, coma, death	<b>CNS: Granulomatous amoebic meningoencephalitis (GAE)</b> -Hematogenous spread → granulomas ( <b>space occupying lesions</b> ). -Infected tissues contain <b>trophozoites, cysts</b> and multinucleated giant cells. <b>-Signs of ↑ ICP</b>  <b>Eye (Amoebic keratitis)</b> <b>Cause:</b> Contaminated water/contact lenses → corneal infection & ulceration <b>Features:</b> Unilateral eye pain, photophobia, annular corneal infiltration, conjunctival congestion <b>Complications:</b> Vision loss & eye perforation  <b>Chronic granulomatous skin lesions</b>
Diagnosis		<b>Clinical diagnosis</b> History of swimming in lakes, few days before the disease  <b>Lab diagnosis</b> <b>a.CSF analysis (lumbar puncture):</b> trophozoites, ↑ CSF pressure, ↑ Protein (>1 g/L) , ↑ polymorphs, purulent <b>b-Culture of CSF on <b>non nutrient agar (with E. coli)</b></b> <b>c-Intracerebral inoculation</b> of mice <b>d- Molecular diagnosis (PCR)</b>	<b>GAE of CNS</b> <b>a-CSF examination:</b> Trophozoites & cysts in brain/CSF. <b>b-Culture of CSF on <b>non nutrient agar (with E. coli)</b></b> <b>c-CT scan</b> of brain. <b>Amoebic keratitis</b> Detect organism via corneal scraping → microscopy, staining, or culture.
Prevention		-Public education. -Adequate chlorination of swimming pools and water supplies.	1) Health education. 2) Avoid swimming in stagnant water. 3) The use of proper contact lens solution.
Treatment		1- Hospitalization 2- I.V. Amphotericin-B, Fluconazole and Rifampicin.	<b>CNS:</b> Sulfamethoxazole/Trimethoprim+ Fluconazole and Rifampin.

	Secondary Amoebic Cerebral Abscess (E. Histolytica)	Neurocysticercosis (T. solium)
Mode of infection	<ul style="list-style-type: none"> <li>-Ingestion of <b>mature quadrinucleated cysts (infective stage)</b> in contaminated food or drink.</li> <li>-Mechanical transmission by flies and cockroaches.</li> <li>-Auto-infection (feco-oral route)</li> </ul>	<p><b>Ingestion</b> of food or water contaminated by the eggs <b>(Infective stage)</b>.</p> <p><b>Auto-infection:</b></p> <p><b>a- External:</b> Feco-oral.</p> <p><b>b- Internal:</b> anti-peristaltic→ regurgitation of the gravid segments from small intestine to the stomach.</p>
Morphology	<p><b>Trophozoite</b></p> <ul style="list-style-type: none"> <li>-<b>Shape:</b> Irregular outline with pseudopodia</li> <li>-<b>Nucleus:</b> Has centrally located fine karyosome and peripheral chromatin dots</li> </ul>	<p>—————</p>
Pathogenesis & Clinical picture	<ul style="list-style-type: none"> <li>-<b>Trophozoite</b> invades brain tissue <b>(no cysts in tissue)</b></li> <li>-<b>Spreads from large intestine</b> → blood vessels → extraintestinal amoebiasis (liver, lung, brain)</li> <li>-<b>Hematogenous spread</b> → Single brain abscess → 2ry amoebic meningoencephalitis, brain tissue destruction</li> <li>-<b>Acts as a brain tumor</b> (space-occupying lesion)</li> </ul>	<p><b>Larval stage</b> (Cysticercus cellulosa) <b>invades CNS</b></p> <ul style="list-style-type: none"> <li>-<b>Humans act as intermediate hosts</b></li> <li>-Cyst causes <b>local inflammation</b> (neutrophils, eosinophils, lymphocytes)</li> <li>-<b>Acts as a brain tumor</b> (space-occupying lesion)</li> <li>-Causes <b>severe headache</b>, convulsions, paralysis</li> </ul>
Diagnosis	<ol style="list-style-type: none"> <li><b>1. Microscopic examination:</b> Detection of trophozoites in CSF samples.</li> <li><b>2. Serodiagnosis:</b> amoebic antigens or antibodies can be detected by ELISA.</li> <li><b>3. Radiological:</b> Ultrasound, CT or MRI</li> </ol>	<ol style="list-style-type: none"> <li><b>1. Serological:</b> I.H.A.T and ELISA.</li> <li><b>2. Imaging:</b> Ultrasound, C.T. and MRI.</li> <li><b>3. X-ray</b> for calcified cyst.</li> <li><b>4. Biopsy</b> for histopathological examination.</li> </ol>
Prevention	<ul style="list-style-type: none"> <li>-Health education</li> <li>-Safe water &amp; proper sewage disposal</li> <li>-Case treatment</li> <li>-Examination of food handler</li> <li>-Insect control</li> </ul>	<ul style="list-style-type: none"> <li>-<b>Early treatment</b> of infected persons (prevent autoinfection)</li> <li>-<b>Avoid nauseating drugs</b> in infected patients</li> <li>-<b>No human excreta</b> as fertilizer</li> <li>-<b>Personal hygiene</b>, fly control, wash raw vegetables</li> </ul>
Treatment	<p><b>Tissue amoebicides</b> (Act against trophozoite):</p> <ul style="list-style-type: none"> <li>-Metronidazole.</li> <li>-Tinidazole.</li> </ul>	<ul style="list-style-type: none"> <li>-<b>Surgical removal</b> when possible.</li> <li>-<b>Praziquantel</b> combined with corticosteroids.</li> <li>-<b>Albendazole</b> is also effective.</li> </ul>
