

Anatomy of white matter

| Commissural fibers | Association fibers | Projection fibers | | | | | | | | |
|--|---|---|-------------|--|---------------------|---|-----------------|--|---|--|
| Definition | | | | | | | | | | |
| They connect the same cortical areas of the two different cerebral hemispheres | Connect different cortical areas in the same cerebral hemisphere | They connect the cerebral cortex with the subcortical areas & form a compact bundle = internal capsule | | | | | | | | |
| Types | | | | | | | | | | |
| <p>A. Corpus Callosum:</p> <p>➔ Parts:</p> <table border="1"> <tr> <td>Rostrum</td> <td>- Continuous with the lamina terminalis.</td> </tr> <tr> <td>Genu</td> <td>- The Anterior end - Fibers form the forceps minor - Connects the 2 frontal lobes</td> </tr> <tr> <td>Body (trunk)</td> <td>- The central part - Fibers form the radiation of corpus - The posterior fibers form tapetum, which connects the 2 temporal lobes.</td> </tr> <tr> <td>Splenium</td> <td>- The posterior end - form the forceps major - connects 2 occipital lobes</td> </tr> </table> <p>➔ Function:</p> <ul style="list-style-type: none"> - Transfer of information (memory and language) between the 2 hemispheres <p>➔ Lesion: Callosal Apraxia.</p> <ul style="list-style-type: none"> - The memory and language processes will not be accessible to the nondominant hemisphere causing left side disorders <p>B. Anterior Commissure: connects the 2 temporal lobes</p> <p>C. Posterior Commissure: It connects: (POS)</p> <ul style="list-style-type: none"> - The pretectal nucleus & the Edinger Westphal nuclei for the bilateral light reflex. - The 2-oculomotor nuclei for the upward gaze. - The 2 superior colliculi. <p>D. Hippocampal Commissure: connects the 2 fornices & the 2 hippocampi</p> <p>E. Habenular Commissure: connects the habenular nuclei of the 2 sides</p> | Rostrum | - Continuous with the lamina terminalis. | Genu | - The Anterior end - Fibers form the forceps minor - Connects the 2 frontal lobes | Body (trunk) | - The central part - Fibers form the radiation of corpus - The posterior fibers form tapetum, which connects the 2 temporal lobes. | Splenium | - The posterior end - form the forceps major - connects 2 occipital lobes | <p>A. Short Association Fibers:</p> <ul style="list-style-type: none"> - They connect adjacent cortical areas. (Arcuate fibers) <p>B. Long Association Fibers:</p> <ul style="list-style-type: none"> - They connect distant cortical areas: <ol style="list-style-type: none"> 1) Superior longitudinal fasciculus (arcuate fasciculus): connects the 4 lobes. 2) Inferior longitudinal fasciculus: connects the occipital lobe with the temporal lobe. 3) Uncinate fasciculus: forms an arch around the stem of the lateral sulcus and connects the frontal lobe with the temporal lobe. 4) Cingulum: lies in the cingulate gyrus. It is the fiber bundle of the limbic lobe. It connects the cingulate gyrus with the parahippocampal gyrus and ends in the uncus. | <p>A. Ascending projection fibers: mainly thalamocortical fibers.</p> <p>B. Descending projection fibers: such as corticospinal & corticobulbar fibers</p> |
| Rostrum | - Continuous with the lamina terminalis. | | | | | | | | | |
| Genu | - The Anterior end - Fibers form the forceps minor - Connects the 2 frontal lobes | | | | | | | | | |
| Body (trunk) | - The central part - Fibers form the radiation of corpus - The posterior fibers form tapetum, which connects the 2 temporal lobes. | | | | | | | | | |
| Splenium | - The posterior end - form the forceps major - connects 2 occipital lobes | | | | | | | | | |

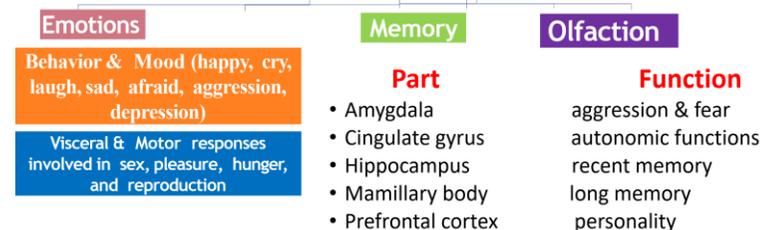

Anatomy of limbic system

| Nuclei | Fiber bundles connecting the nuclei |
|--|--|
| 1) Limbic lobe: formed of the <ul style="list-style-type: none"> - Cingulate gyrus - Para-hippocampal gyrus - Uncus. | 1) Cingulum: fiber bundle of the limbic lobe. |
| 2) Hippocampus: <ul style="list-style-type: none"> - continuous externally with para-hippocampal gyrus. | 2) Fornix: Arises from the hippocampus & terminates in the mamillary body. Formed of 4 parts: <ul style="list-style-type: none"> - Fimbria: nerve fibers on the medial border of the hippocampus. - Crus of the fornix is the continuation of fimbria. - Body of the fornix: fused two crura of the fornix. - Anterior column of the fornix: each one terminates in the mamillary body |
| 3) Hypothalamus: <ul style="list-style-type: none"> - mammillary bodies | 3) Mammillothalamic tract: connects the anterior thalamic nucleus with mamillary body |
| 4) Anterior thalamic nuclei | 4) Anterior thalamic radiation: connects the medial thalamic nucleus with personality center |
| 5) Medial thalamic nuclei | |
| 6) The prefrontal cortex "personality center" | |
| 7) Amygdaloid nucleus "amygdala" | 5) Stria terminalis: it begins in the amygdaloid nucleus and ends in the septal area. |
| 8) Septal area "medial olfactory area": below the rostrum. | |
| 9) Habenular nucleus | 6) Stria medullaris thalami: begins in the septal area and in the habenular nucleus. |

| Functions |
|---|
| 1) Recent memory: the hippocampus has a role in remembering recent events. |
| 2) Emotional behavior: it plays a role in feeling, feeding, aggression, anger, fear, sadness, pleasure and emotions associated with sexual behavior. |
| 3) Olfaction: the uncus is a primary olfactory area. |

What is the function of the limbic system?

It controls a variety of functions

| Lesions |
|--|
| 1) Leads to psychiatry disorders <ul style="list-style-type: none"> - e.g. Schizophrenia, depression and senile dementia |
| 2) Lesions in Hippocampus: <ul style="list-style-type: none"> - loss of recent memory, in Alzheimer's disease there is extensive degeneration of hippocampus |
| 3) Lesions in Amygdaloid nucleus: <ul style="list-style-type: none"> - loss of aggressive behavior, fear & anger |
