

# ECG 1

# Definition of Electrocardiogram (ECG)

**ECG is a modified biphasic record of the electrical activity of the heart during the cardiac cycle.**

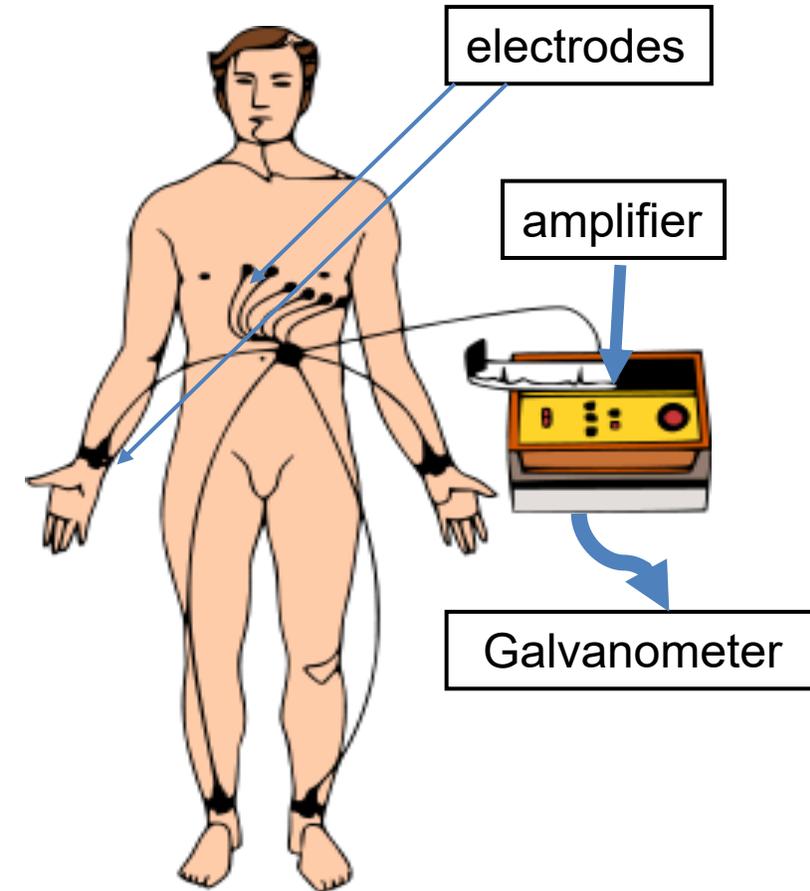

# Electrocardiograph (ECG)

**Apparatus :** Electrocardiograph (ECG)

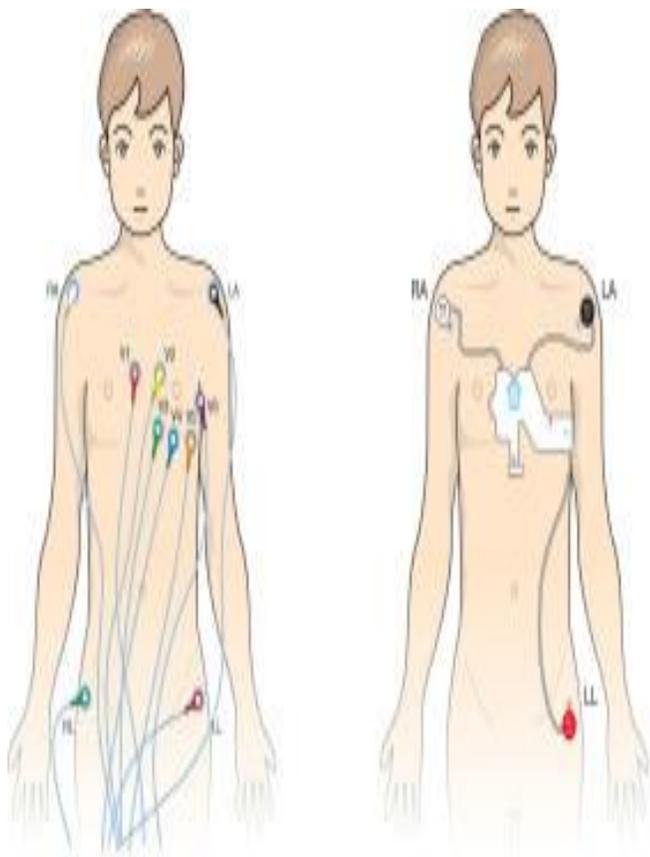

**ECG apparatus consists of;**

1. Sensitive galvanometer.
2. Amplifier which magnifies potential changes recorded by electrodes of galvanometer.
3. Recording electrodes in which:
  - ❖ **Positive or exploring electrode** is attached to +ve pole of galvanometer.
  - ❖ **Negative or indifferent electrode** is attached to –ve pole of galvanometer.

Galvanometer moves a pen recorder which writes on moving paper film.

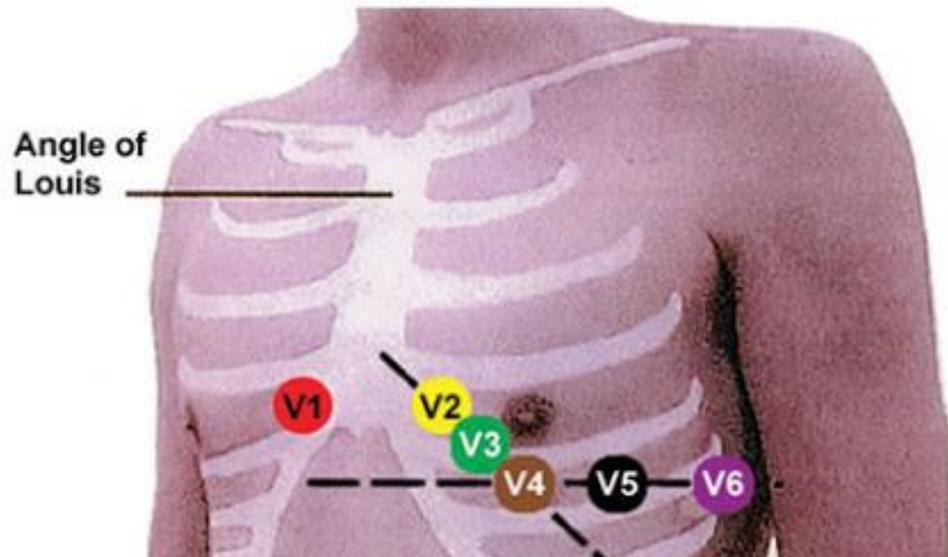

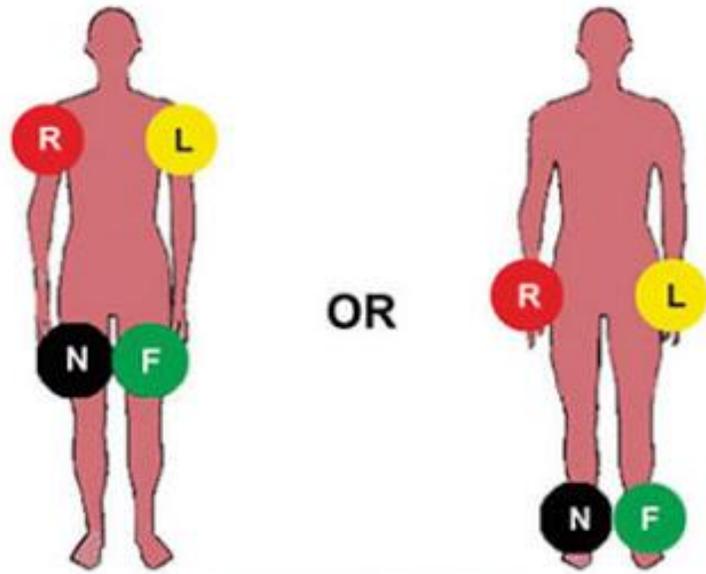

# Placing of ECG Electrodes

Conventional individual electrodes      Prepositioned, preconnected electrodes  
medical Physiology department 2024

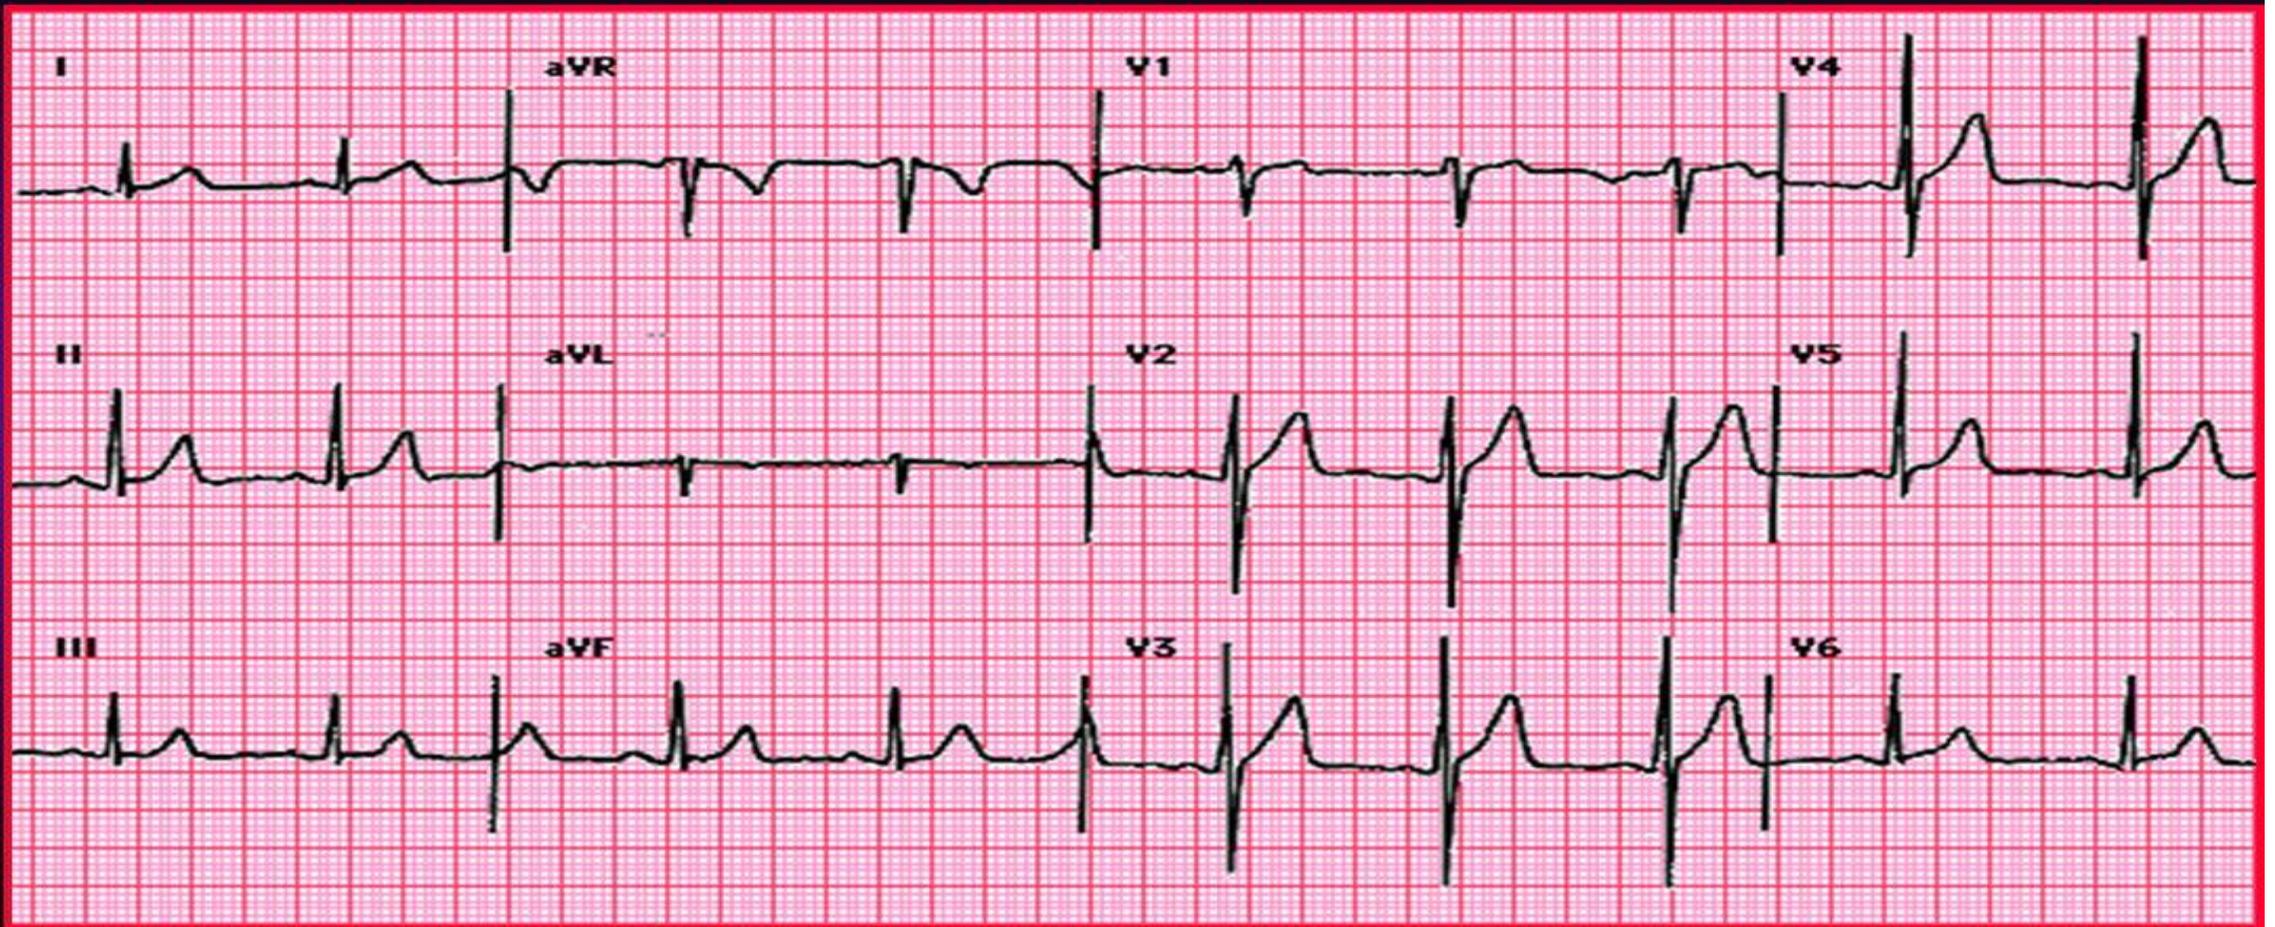

# ECG paper

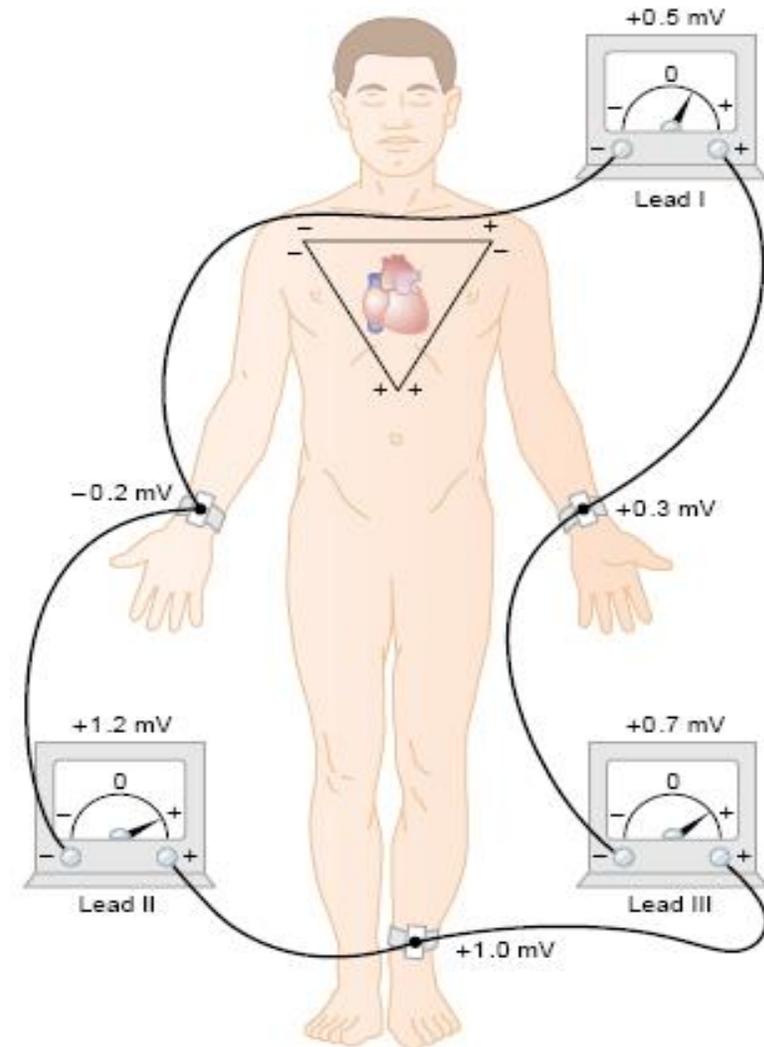

## A standard 12-lead Normal ECG

# Leads

## Definition

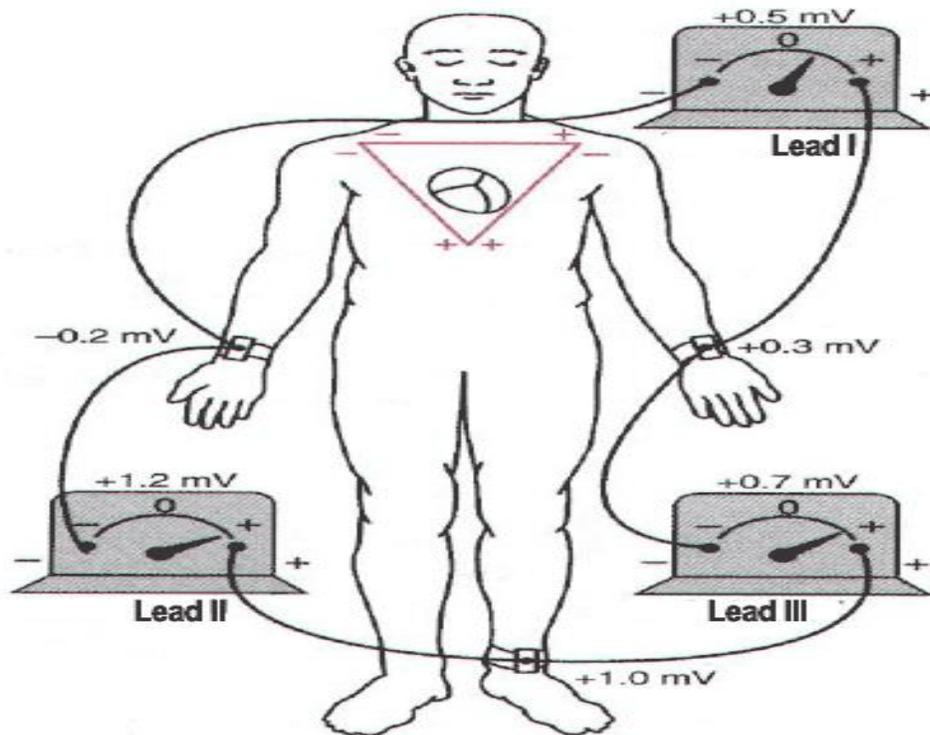

ECG lead is the particular arrangement of 2 electrodes of the ECG galvanometer for recording the cardiac potential.

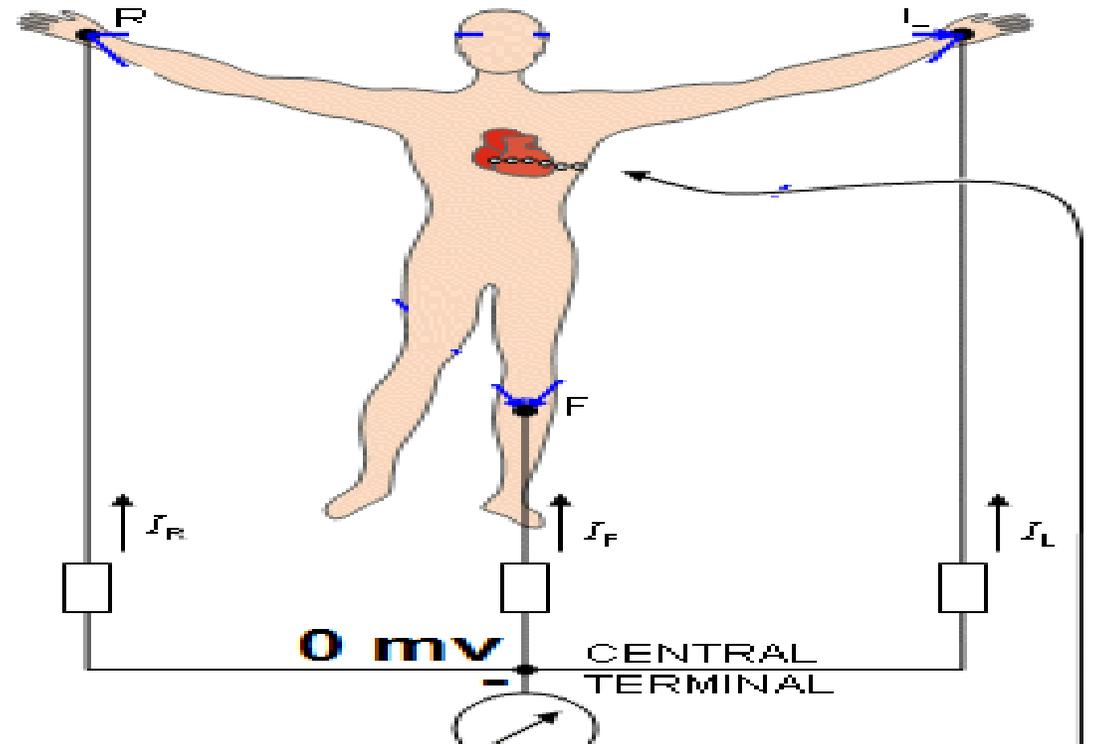

# Leads (12)

- Types :

## Bipolar Limb leads (3)

## Unipolar leads (9)

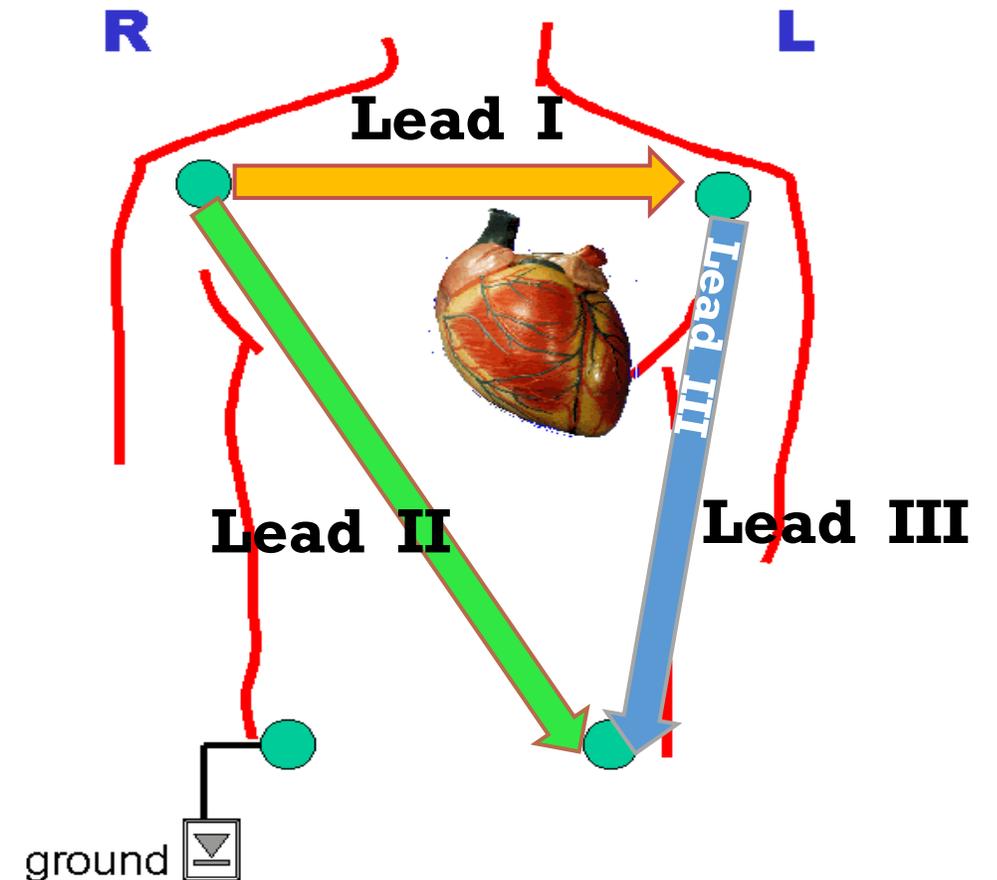

# Bipolar Limb Leads

Lead I (RA (-) and LA (+))

Lead II (RA (-) and LF (+))

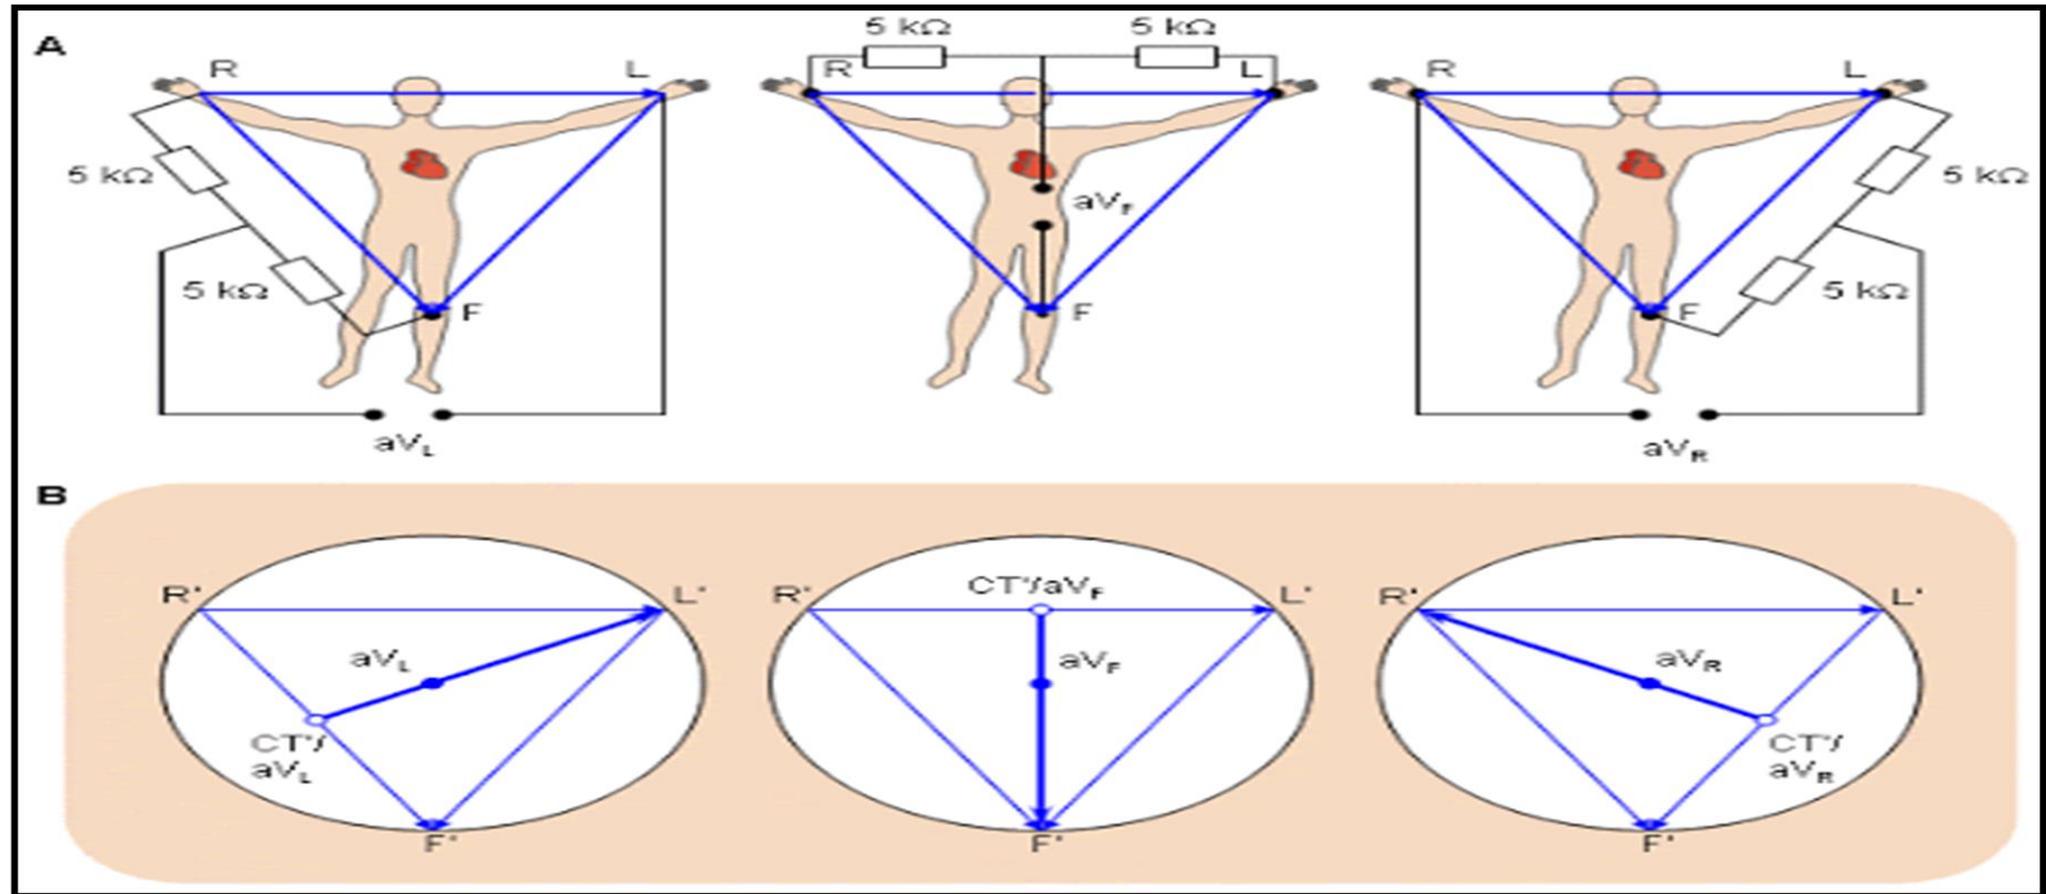

Lead III (LA (-) and LF (+))

# Unipolar Limb Leads

- They measure the potential at limbs (RA, LA and LF)
- The voltage of potentials recorded by these leads is weak, so it must be augmented to form **aVR, aVL, and aVF**
- This done by disconnection of electrode connected to central terminal to limb to be augmented
- So augmented limb leads record potential difference between one limb (+ve electrode) & other 2 limbs (-ve electrode).
- Augmentation increases the voltage of ECG by **50%**.

# Augmented Unipolar Limb Leads

# 6 Unipolar chest Leads

V1 (Rt 4<sup>th</sup> intercostal space)

V2 (Lt 4<sup>th</sup> intercostal space)

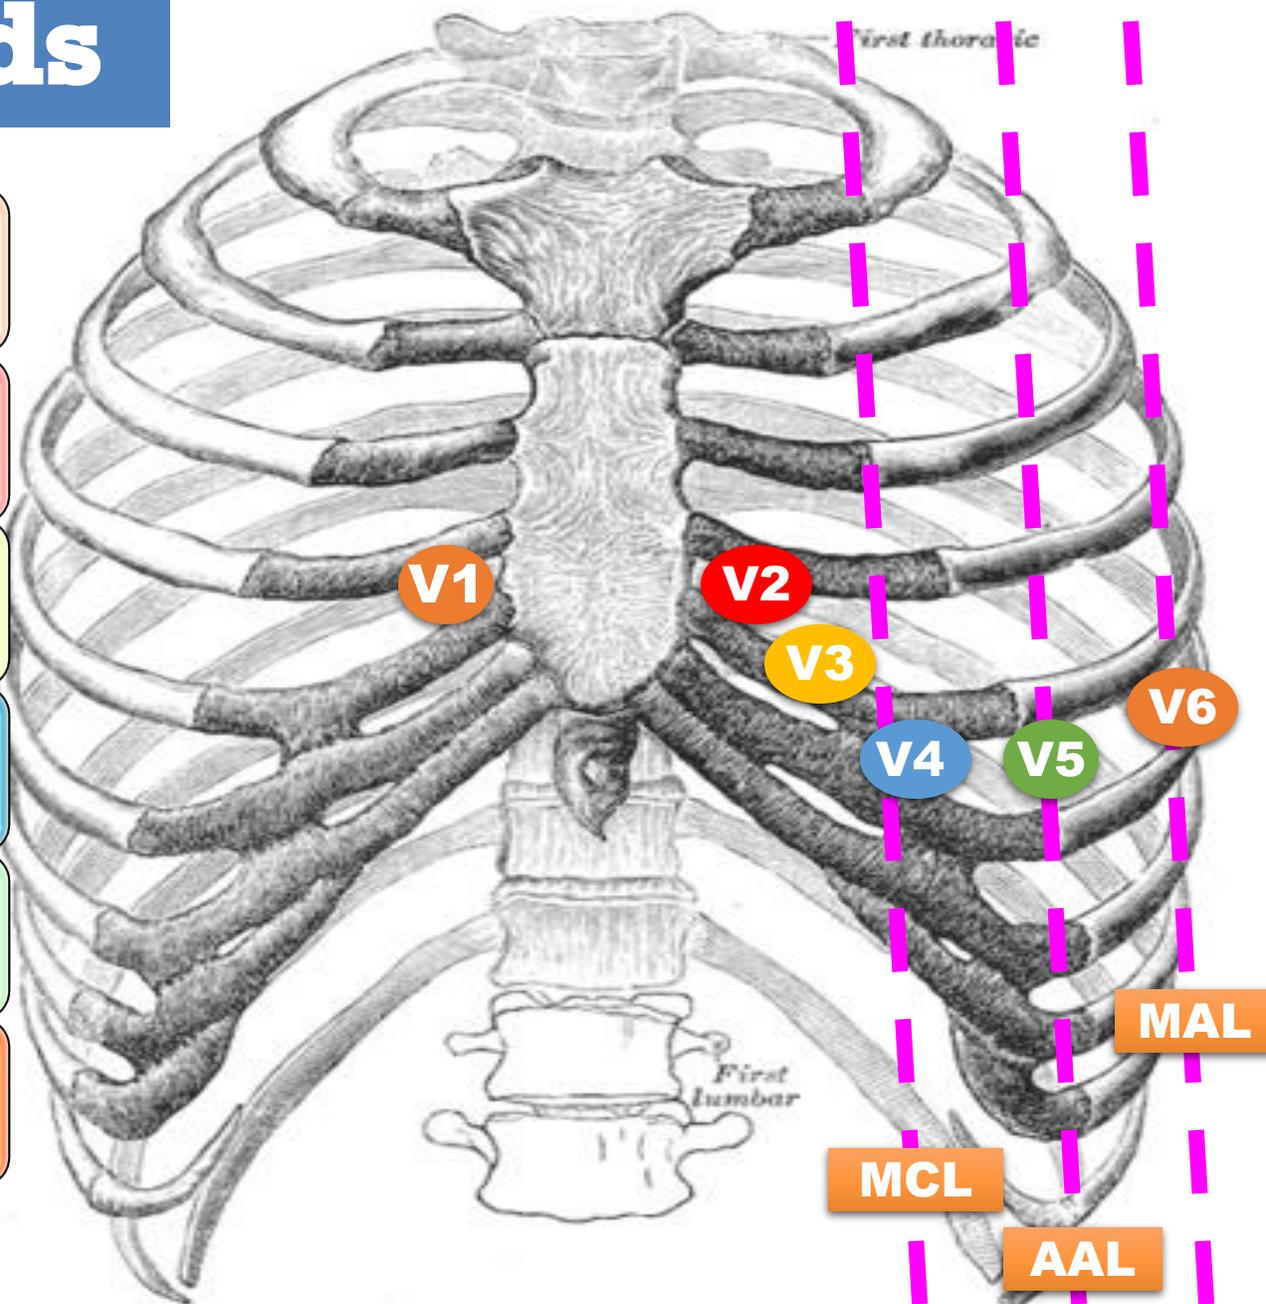

V3 (midway between V2 and V4)

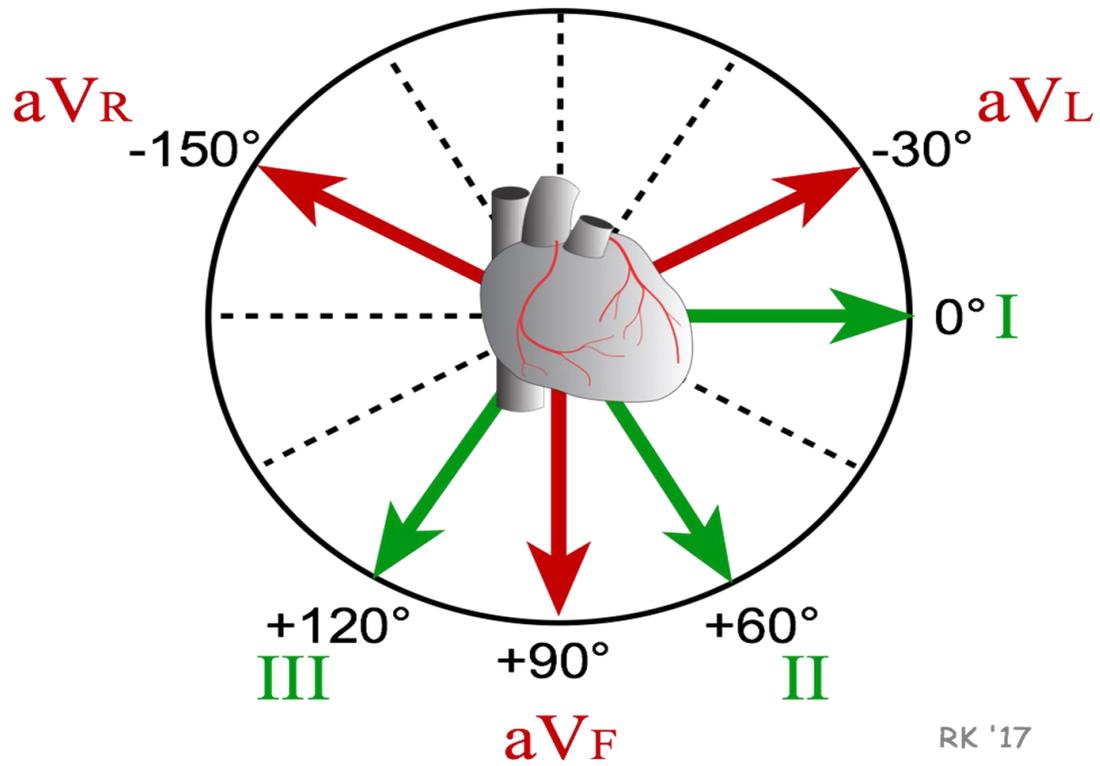

V4 (Lt 5<sup>th</sup> intercostal space midclavicular line)

V5 (Lt 5<sup>th</sup> intercostal space anterior axillary line)

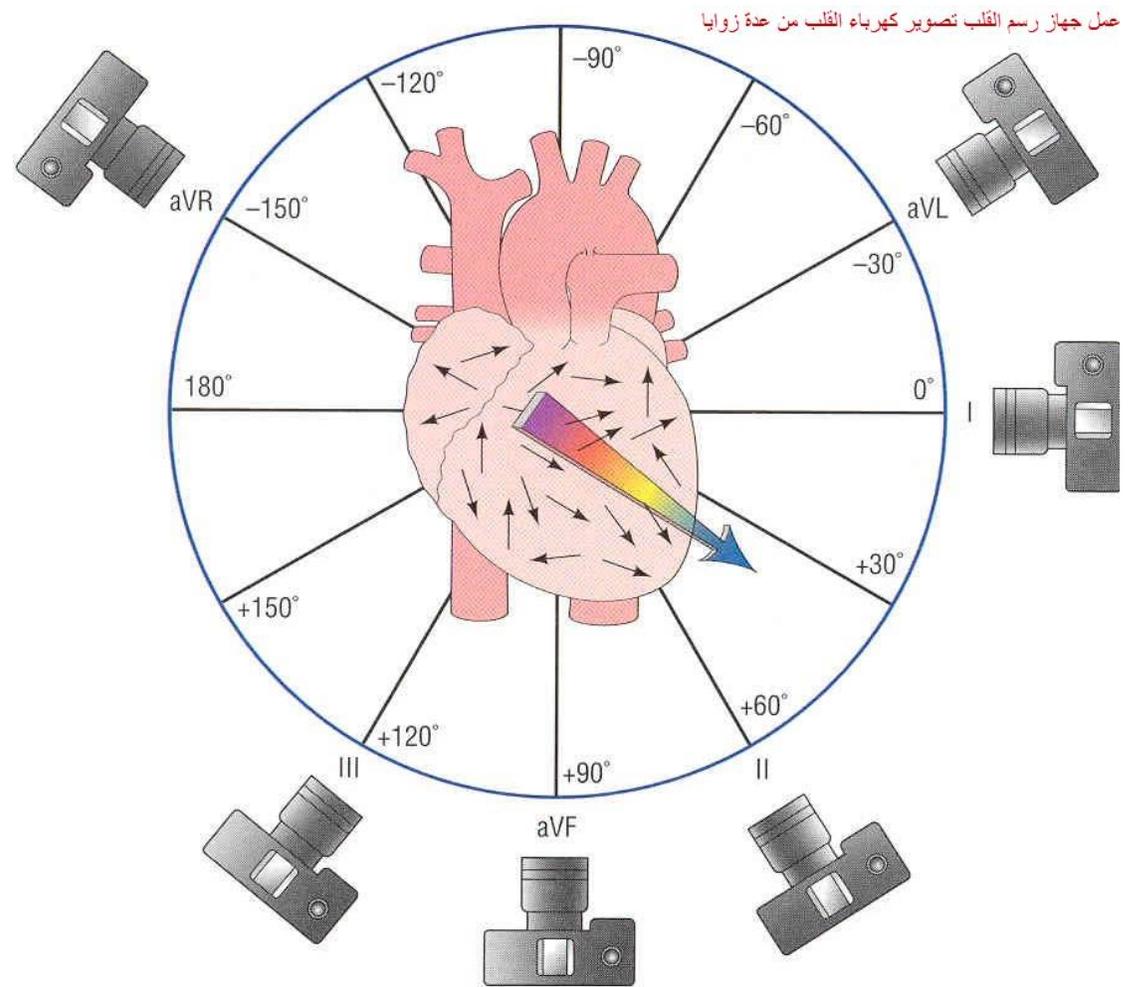

V6 (Lt 5<sup>th</sup> intercostal space midaxillary line)

**N.B.** there are 2 added chest leads; **V7** = 5<sup>th</sup> intercostal space at posterior axillary line and **V3R** on Rt side of chest comparable to V3

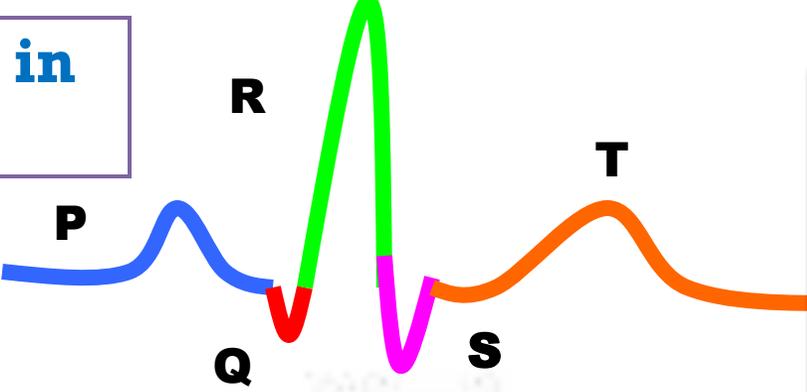

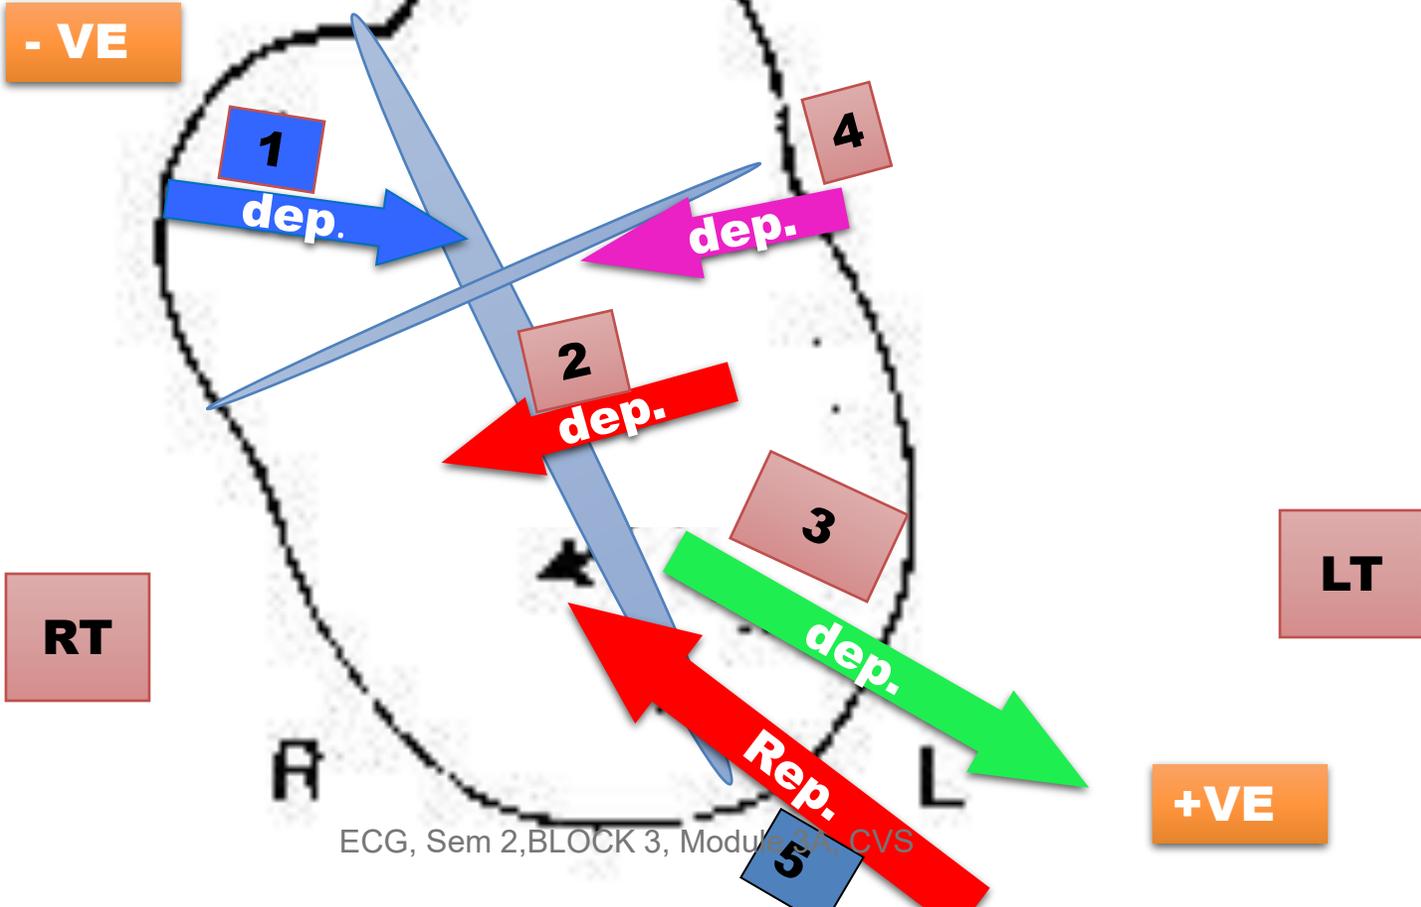

RK '17

**Normal ECG in Lead II**

**T wave represents Ventricular Repolarization**

# Normal ECG

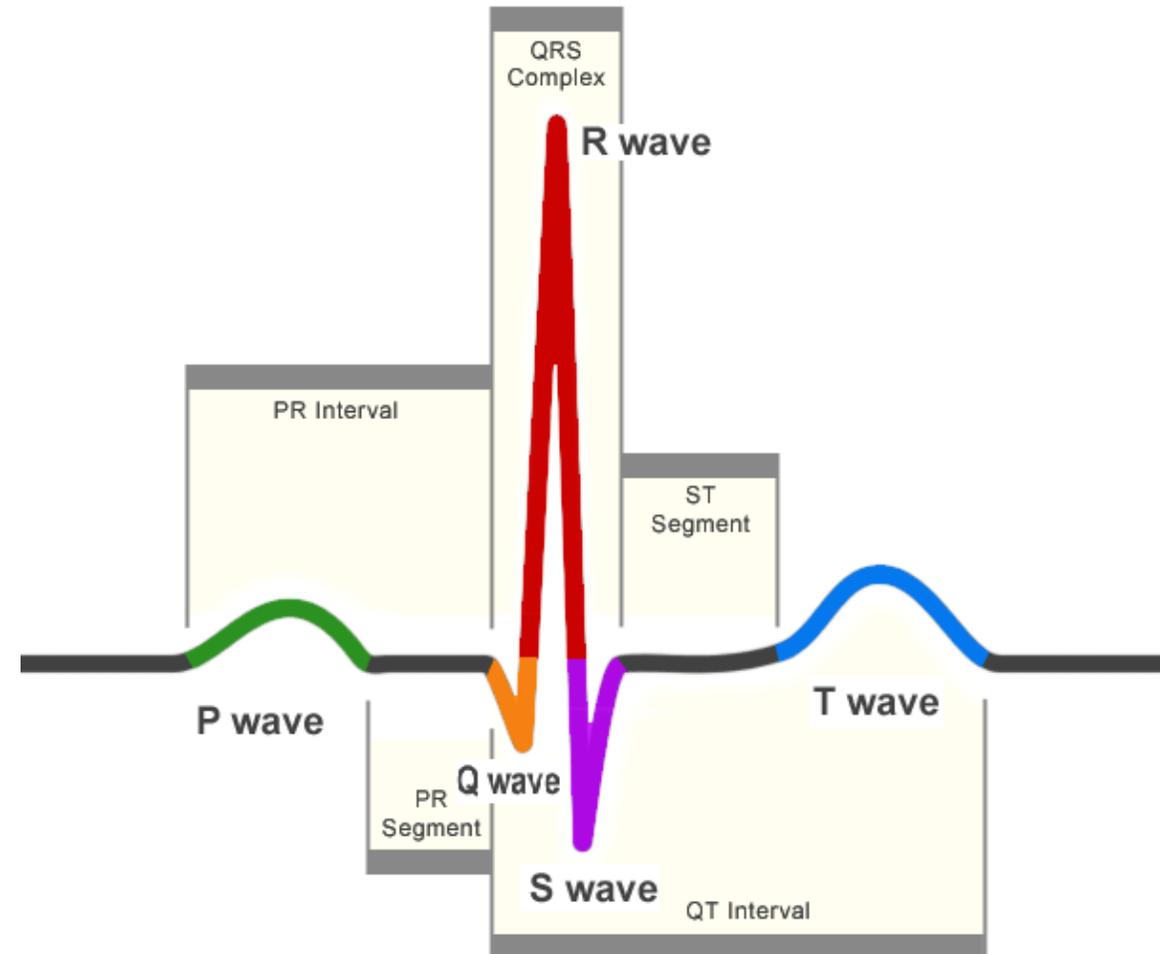

The ECG consists of;

## A) waves:

- 1- the **P wave**: represents atrial depolarization.
- 2- the **QRS complex**: represents ventricular depolarization.
- 3- the **T wave**: represents ventricular repolarization

## B) S-T segment: isoelectric

## C) P-R and Q-T intervals:

# How to comment on ECG ??

1- Calibration or standardization of ECG

2- Calculation of HR

3- Comment on Rhythm

4- Comment on Waves of ECG

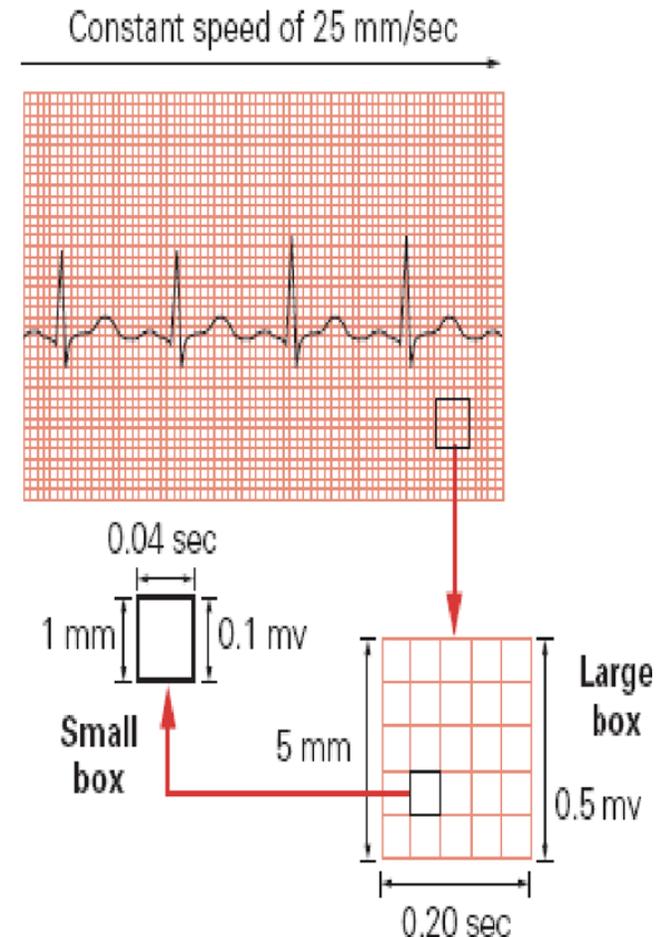

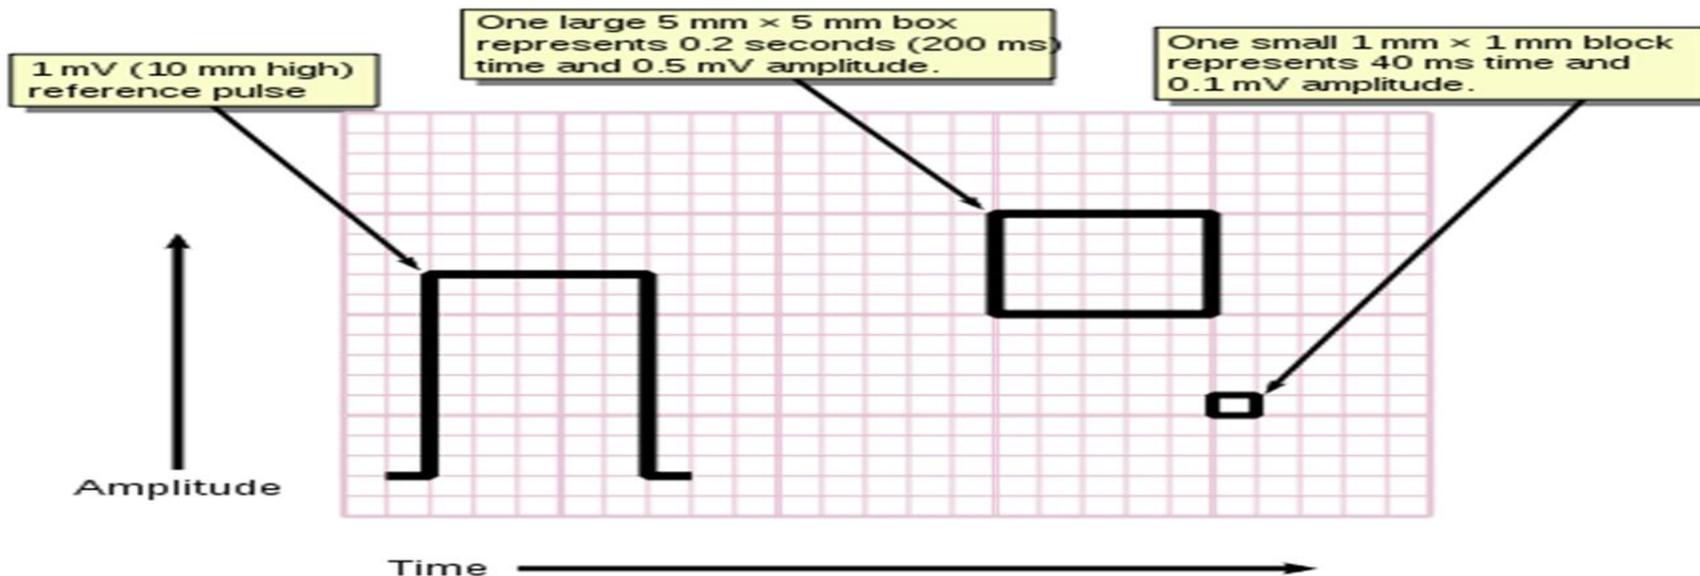

5- Comment on segments

6- Comment on intervals

7- Comment on Axis

# 1- Calibration of ECG Paper

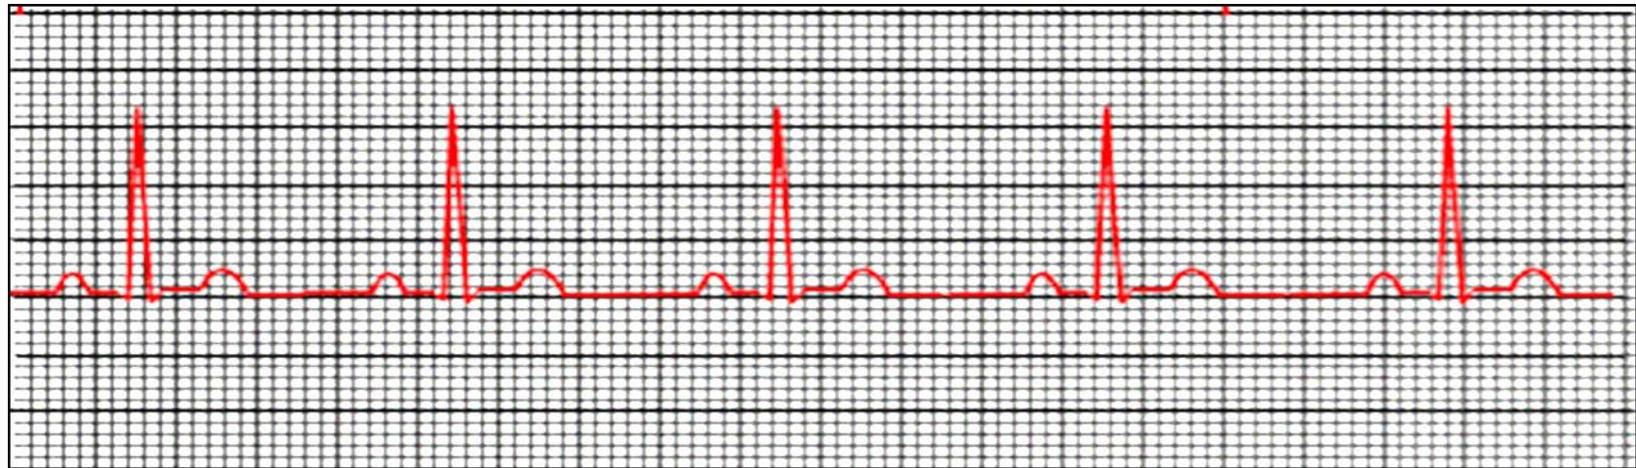

- ECG paper is composed of a number of 1 and 5 mm squares. It calibrated so that,
- Each small square (horizontal)= 0.04 sec.
- Each small square (vertical )= 0.1 mv.

## 2- How to Calculate HR

- By counting the number of small squares between 2 successive R
- divide 1500/no of small squares.
- Or, divide 300/no. of big squares between 2R.

**N.B:** This method is **not accurate** in the presence of disturbance of cardiac rhythm (**dysrhythmia**).

**No. of SS= 20 , so HR = 1500/20 = 75 beat / min**

**Calculate heart rate from the following ECG records:**

**HR = ??**

**HR = ??**

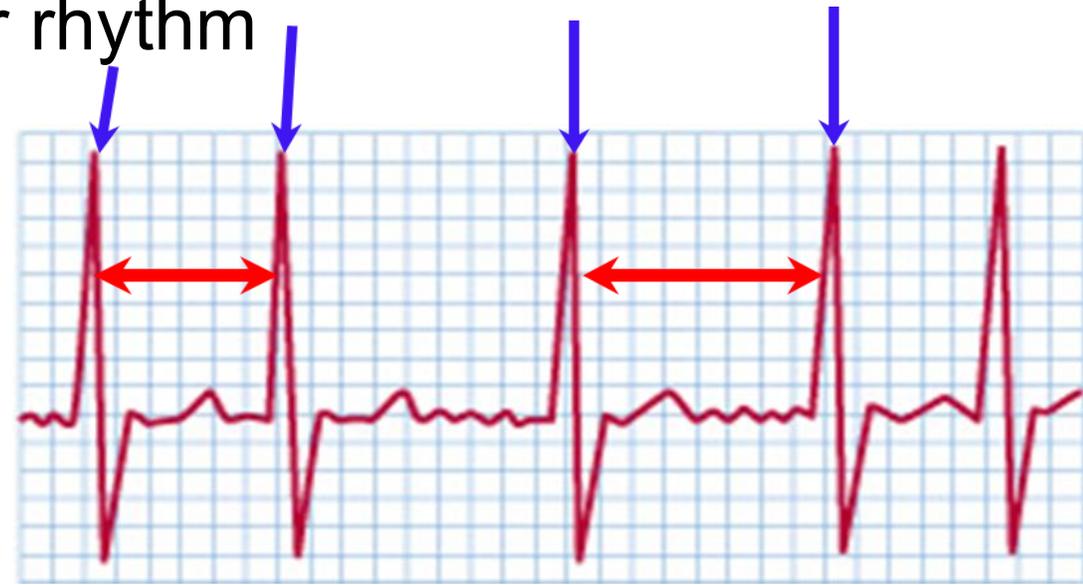

# 3- How to Comment on Rhythm

- Measure the distance ( ) 2 successive R waves and compare it with the distance ( ) another 2 successive R waves, if;  
Equal → regular rhythm  
Unequal → irregular rhythm

**No. of SS= 20**

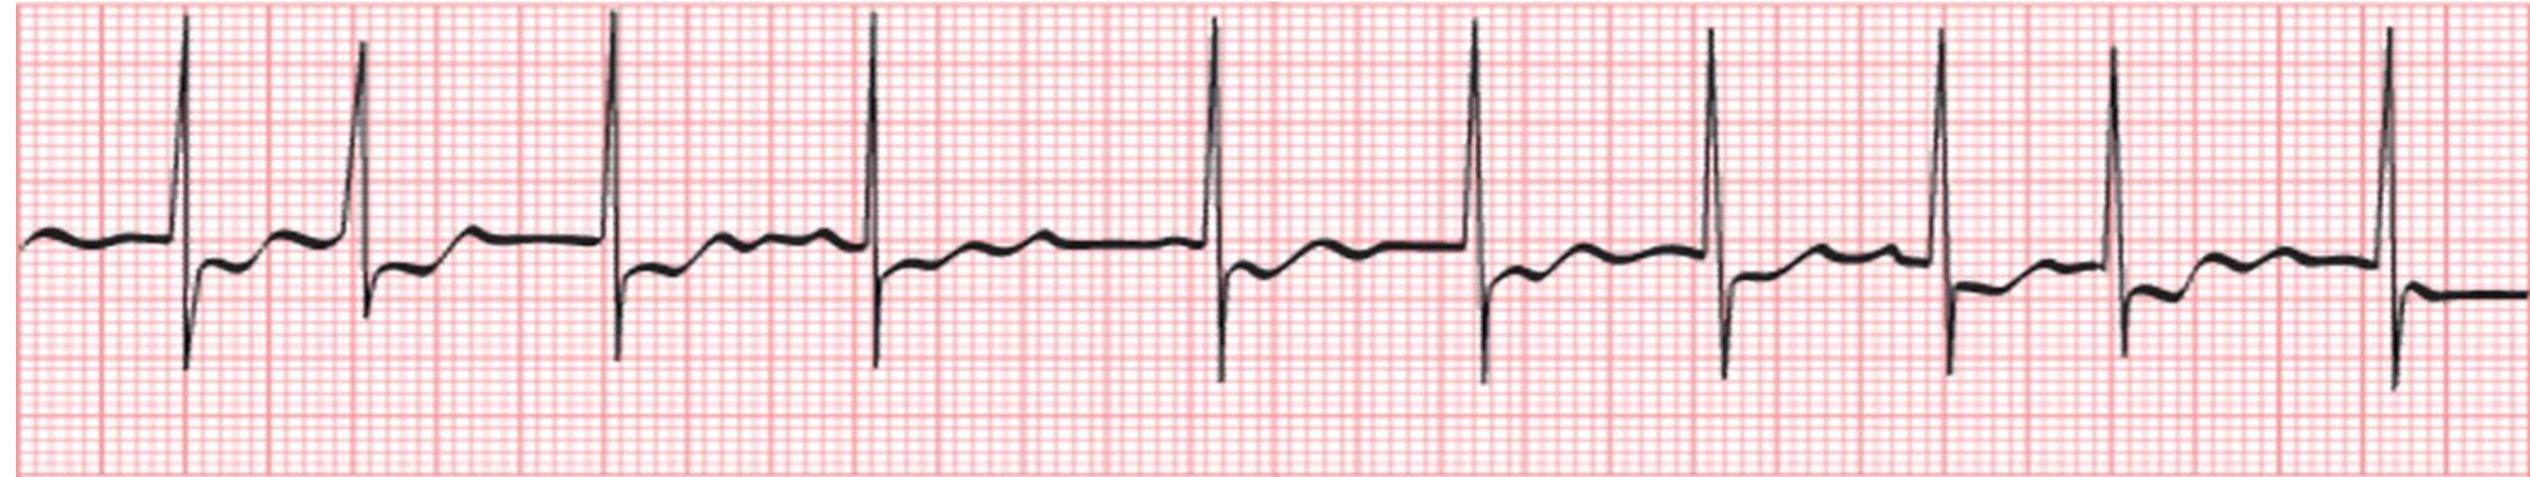

**No. of SS= 20**

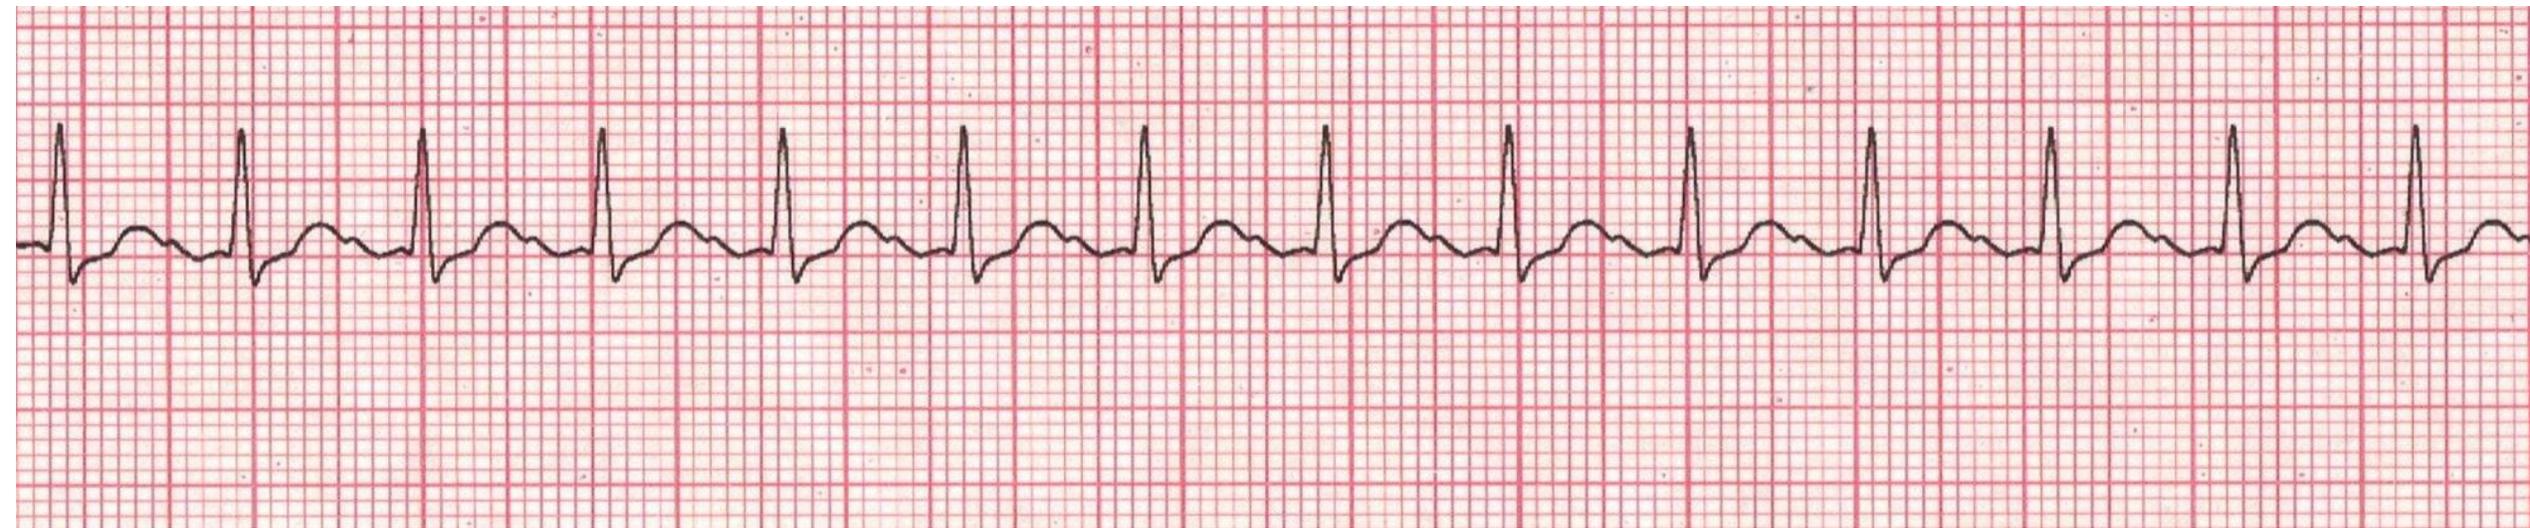

**No. of SS= 27**

**No. of SS=38**

Comment on the rhythm of the following ECGs:

**A.**

**B.**

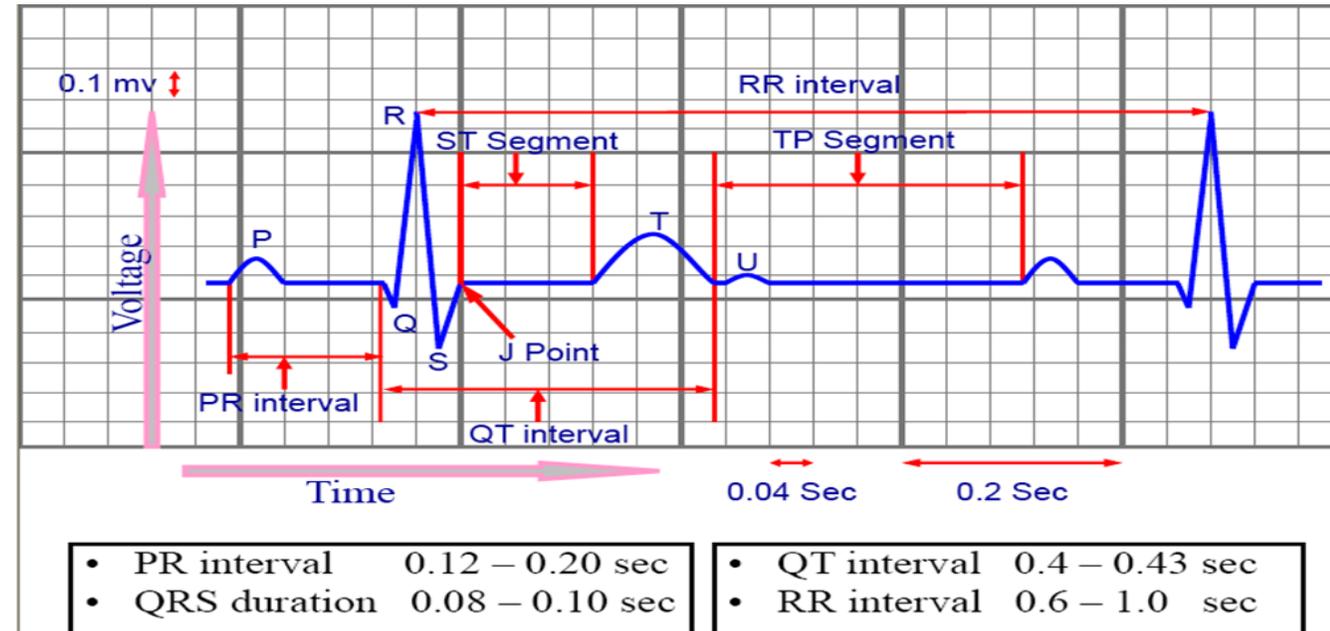

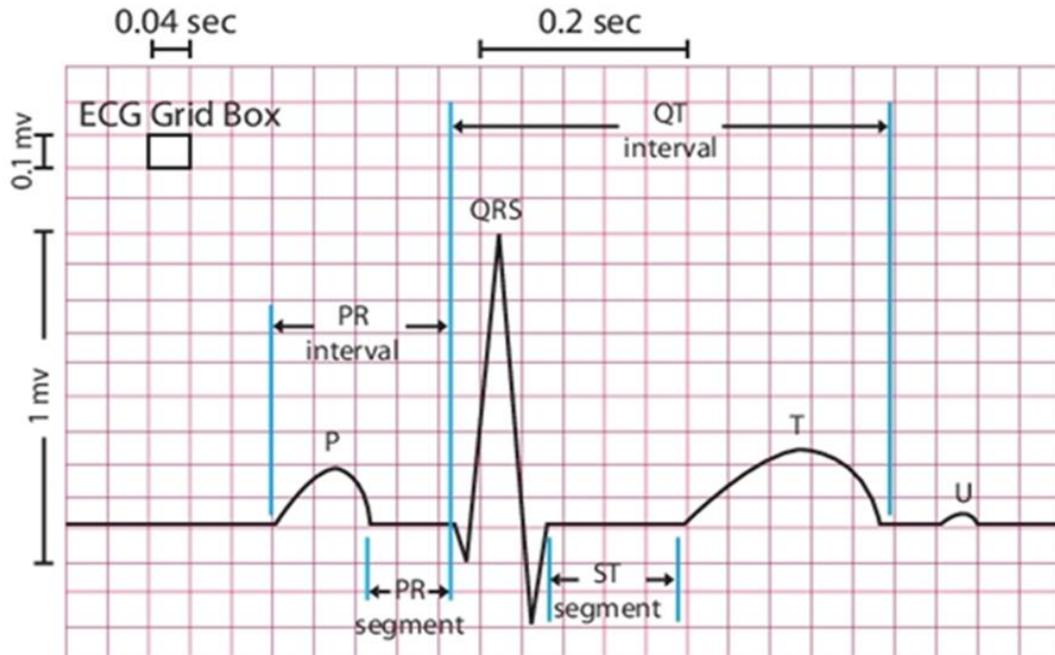

# 5&6- How to comment on ECG segments and Intervals

S-T segment

P-R interval

Q-T interval

a) S-T segment: normally is isoelectric compared to TP segment.

## 5&6- How to comment on ECG segments and Intervals

### b) P-R interval:

It represents the time of conduction of impulse from SAN to ventricles

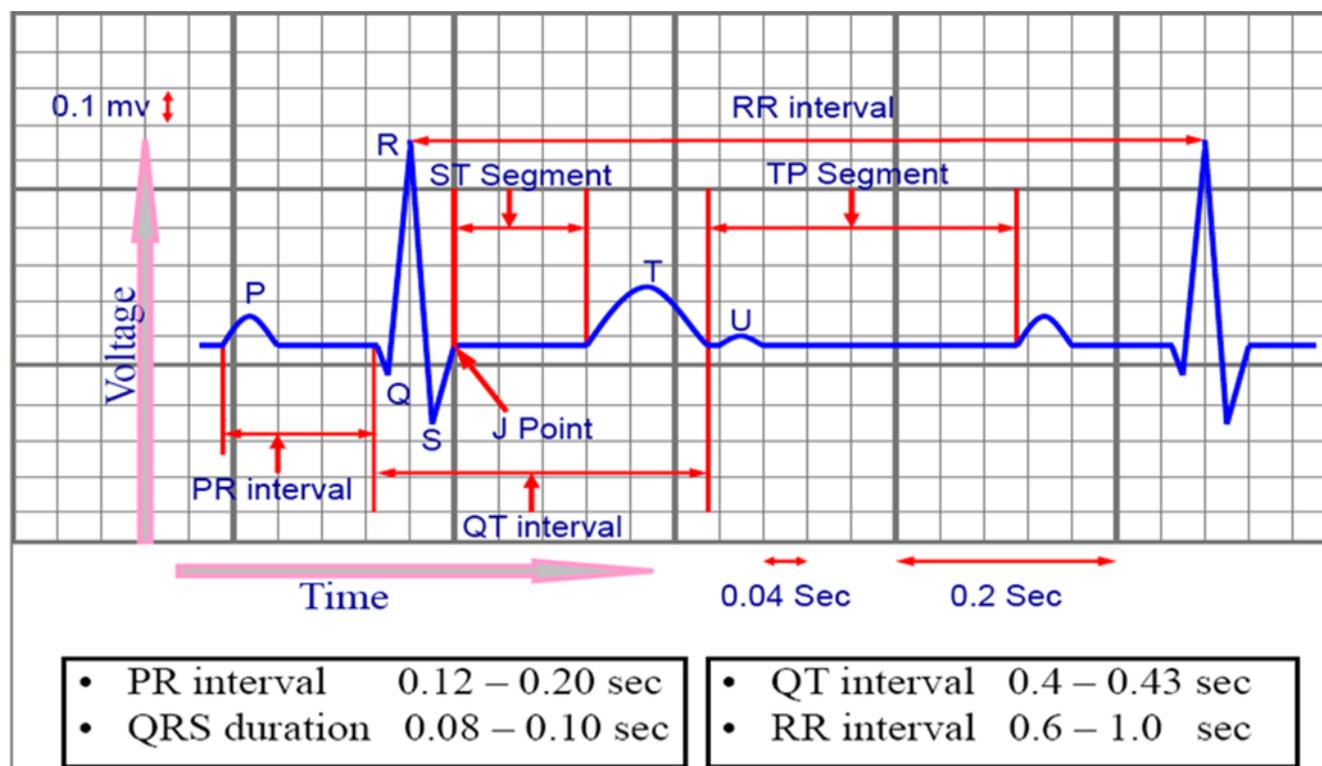

Normally 0.12 to 0.2 sec

### c) Q-T interval:

is the interval from beginning of Q to the end of T.

normally = 0.4 sec.

- Significance: it represents the time needed for ventricular depolarization & repolarization of ventricular muscle.

**Heart sounds**

# Methods of Detection of Heart Sounds

## a) Stethoscope:

2 sounds are only audible by stethoscope

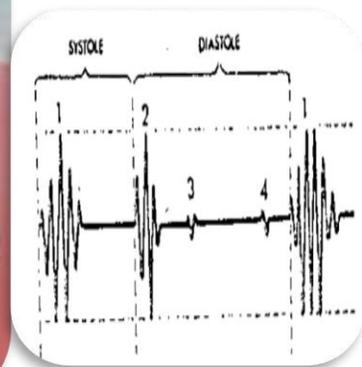

## b) Phonocardiograph:

records for 4 sounds → **phonocardiogram**

(It consists of a specialized microphone that placed on the chest; the heart sounds can be amplified and recorded by a high speed recording apparatus. The recording is called a phonocardiogram, and the heart sounds appear as wave).

# Stethoscope

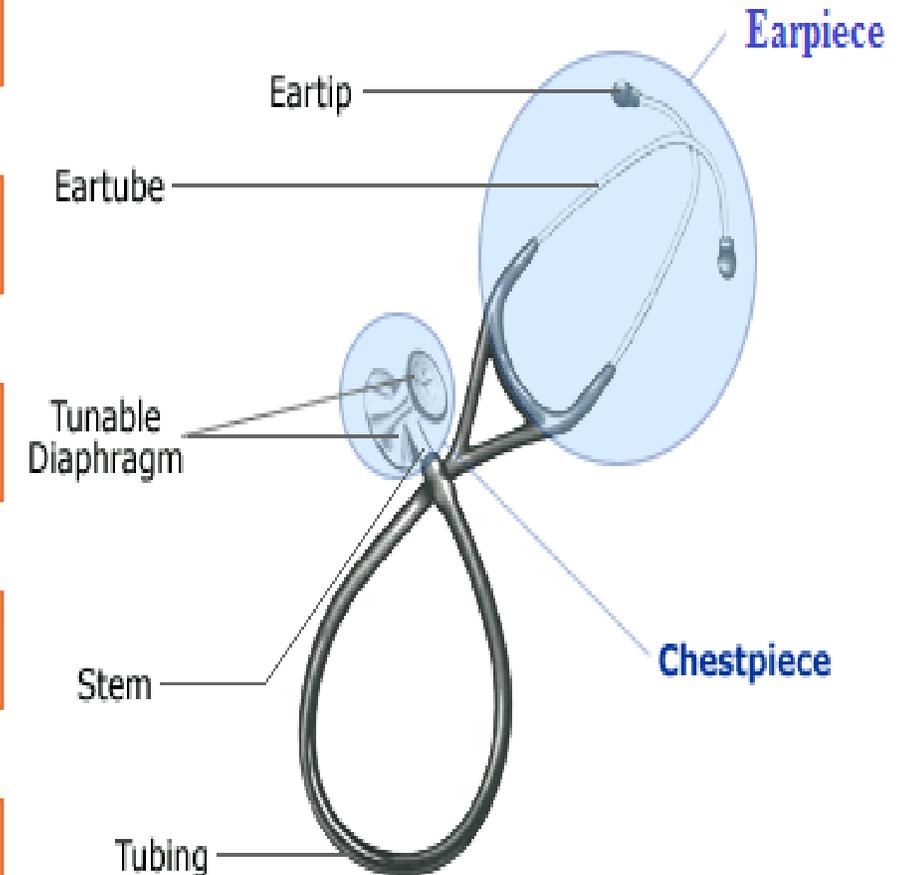

**a. Chest piece** → consists of 2 parts

**Cone of bell** → for low pitched sounds

**Diaphragm** → for high pitched sounds

**b. Ear pieces.**

**c. Rubber tube (50-75 cm).**

## Uses of stethoscope:

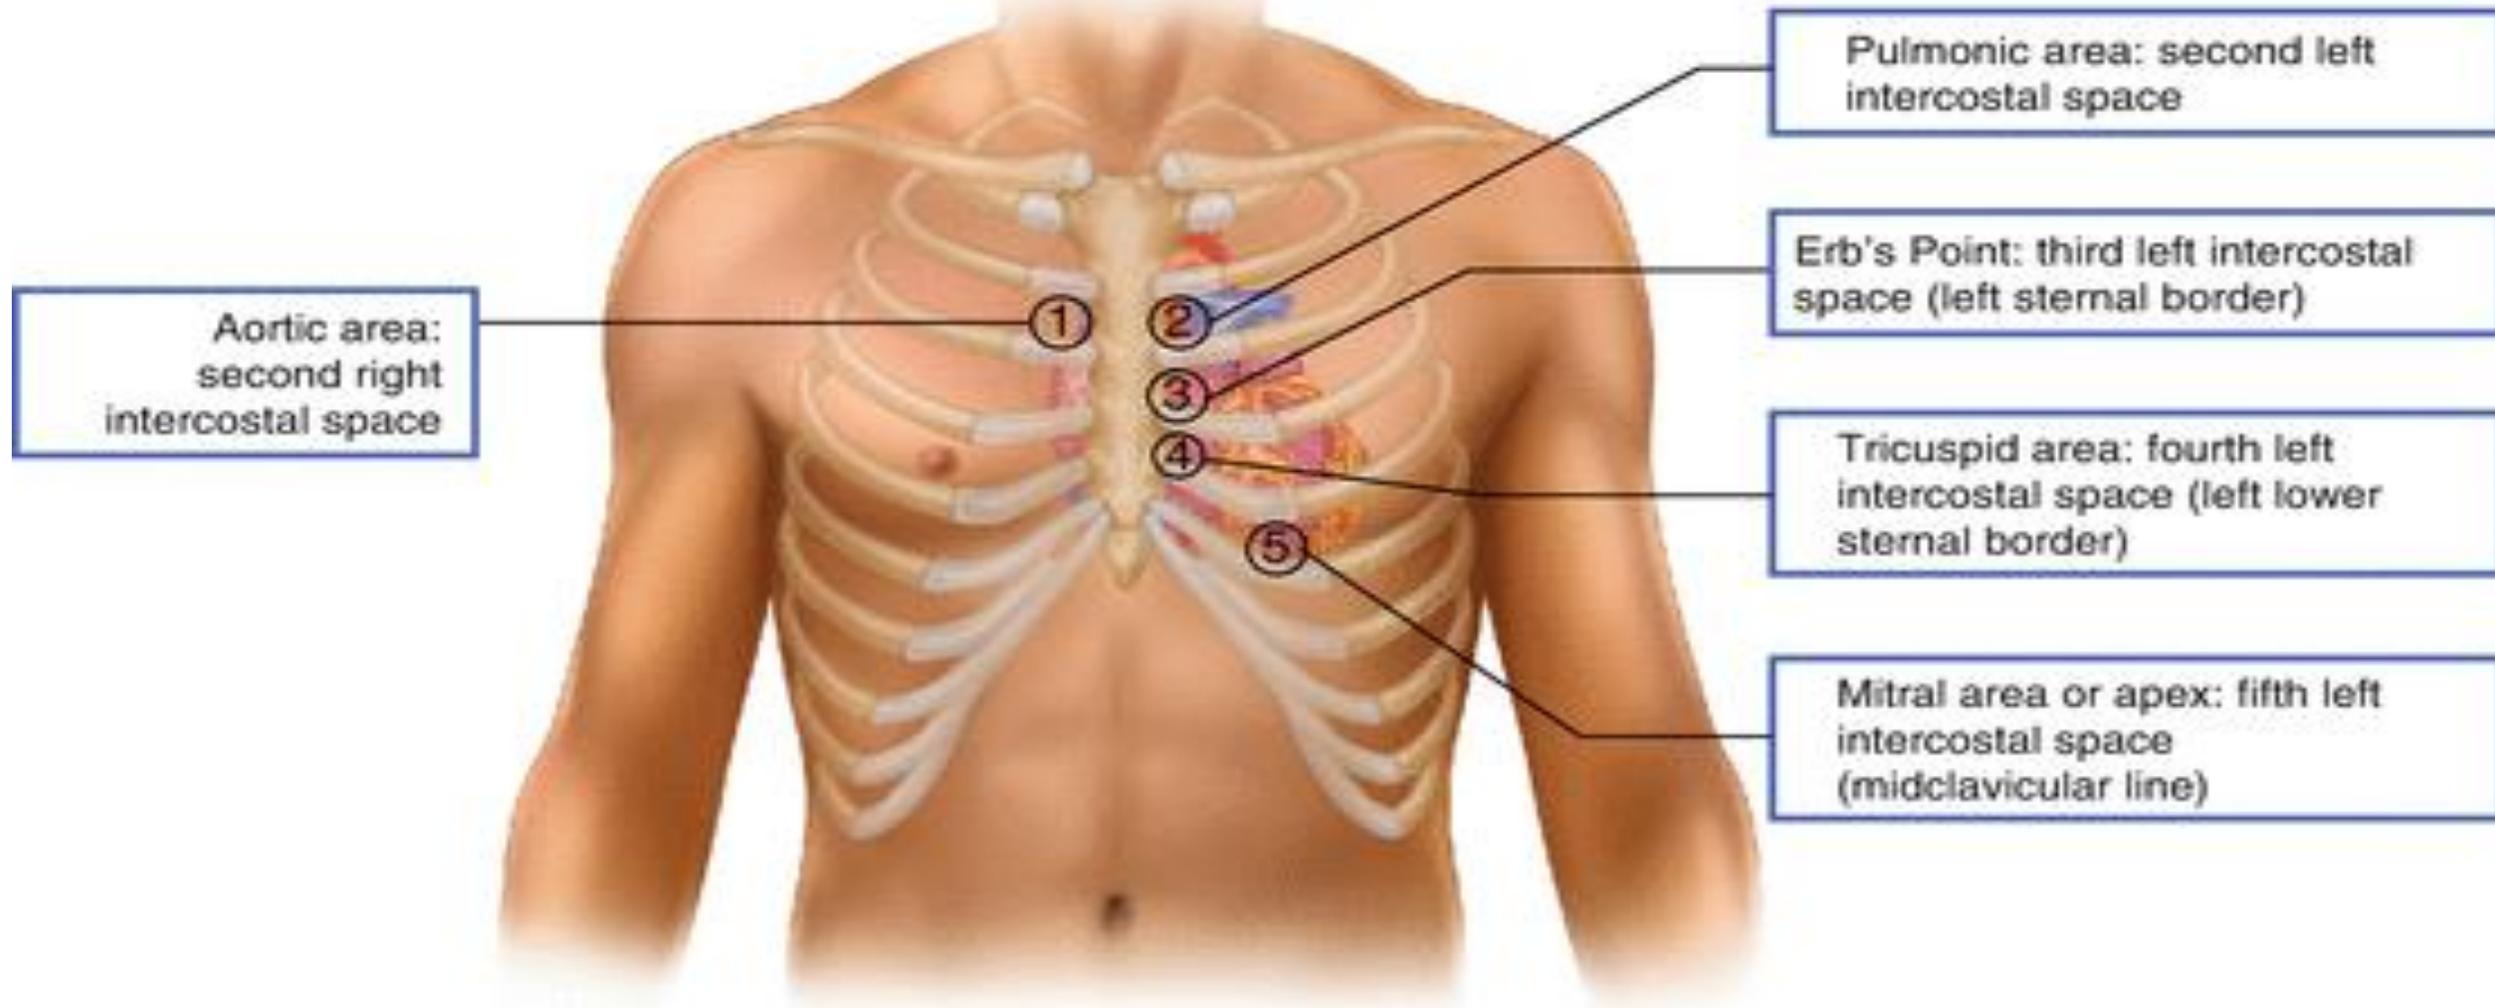

1. Auscultation of heart sounds.

2. Auscultation of breath sounds

3. Auscultation of intestinal sounds

4. Measurement of ABP.

# Pulmonary Function Tests

# Pulmonary Function Tests

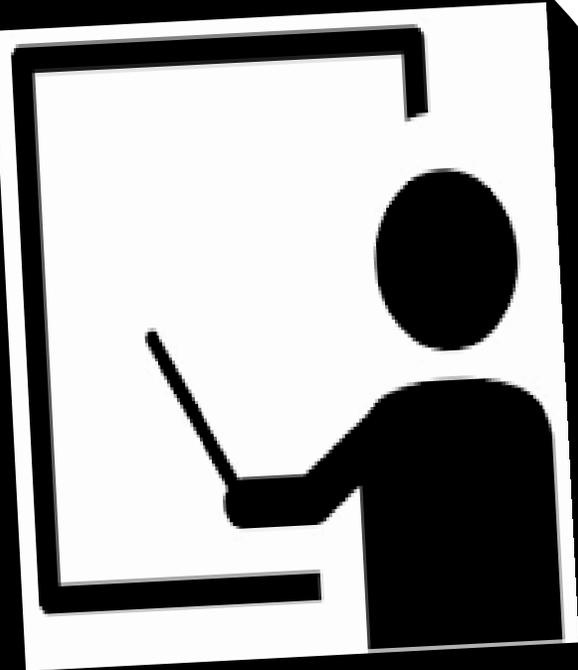

- These tests are divided into 2 groups :

**Static tests (volume based and slow)**

**Dynamic tests (time based ,flow dependent , forced and need exertion)**

# **static Pulmonary Function Tests**

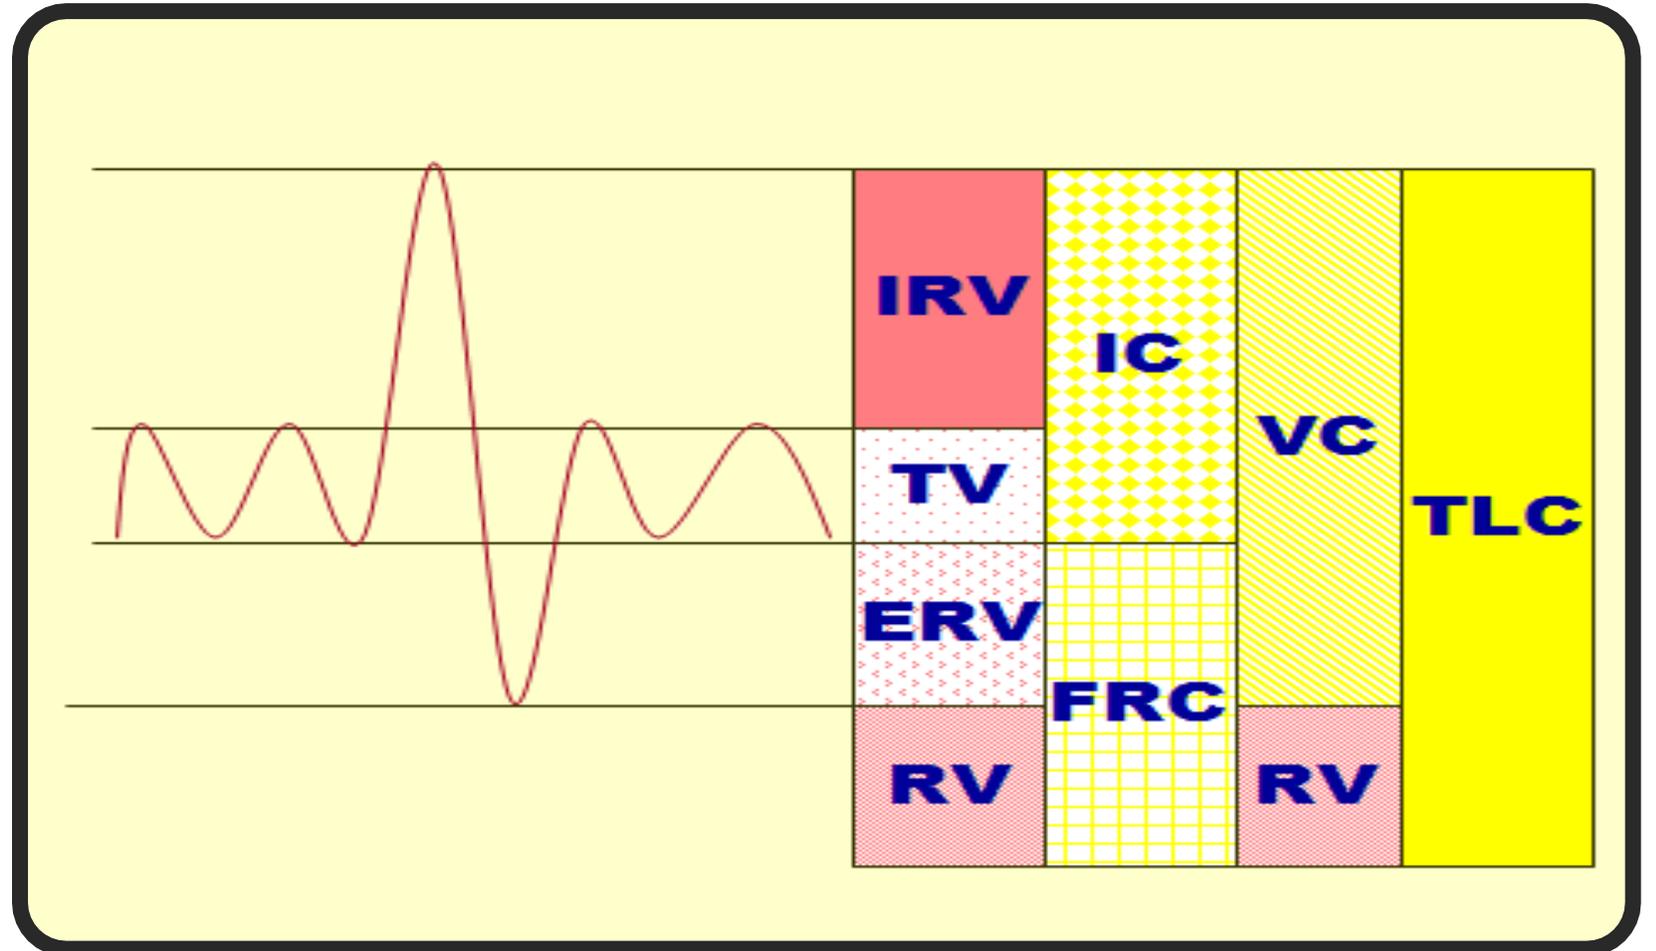

# Spirogram

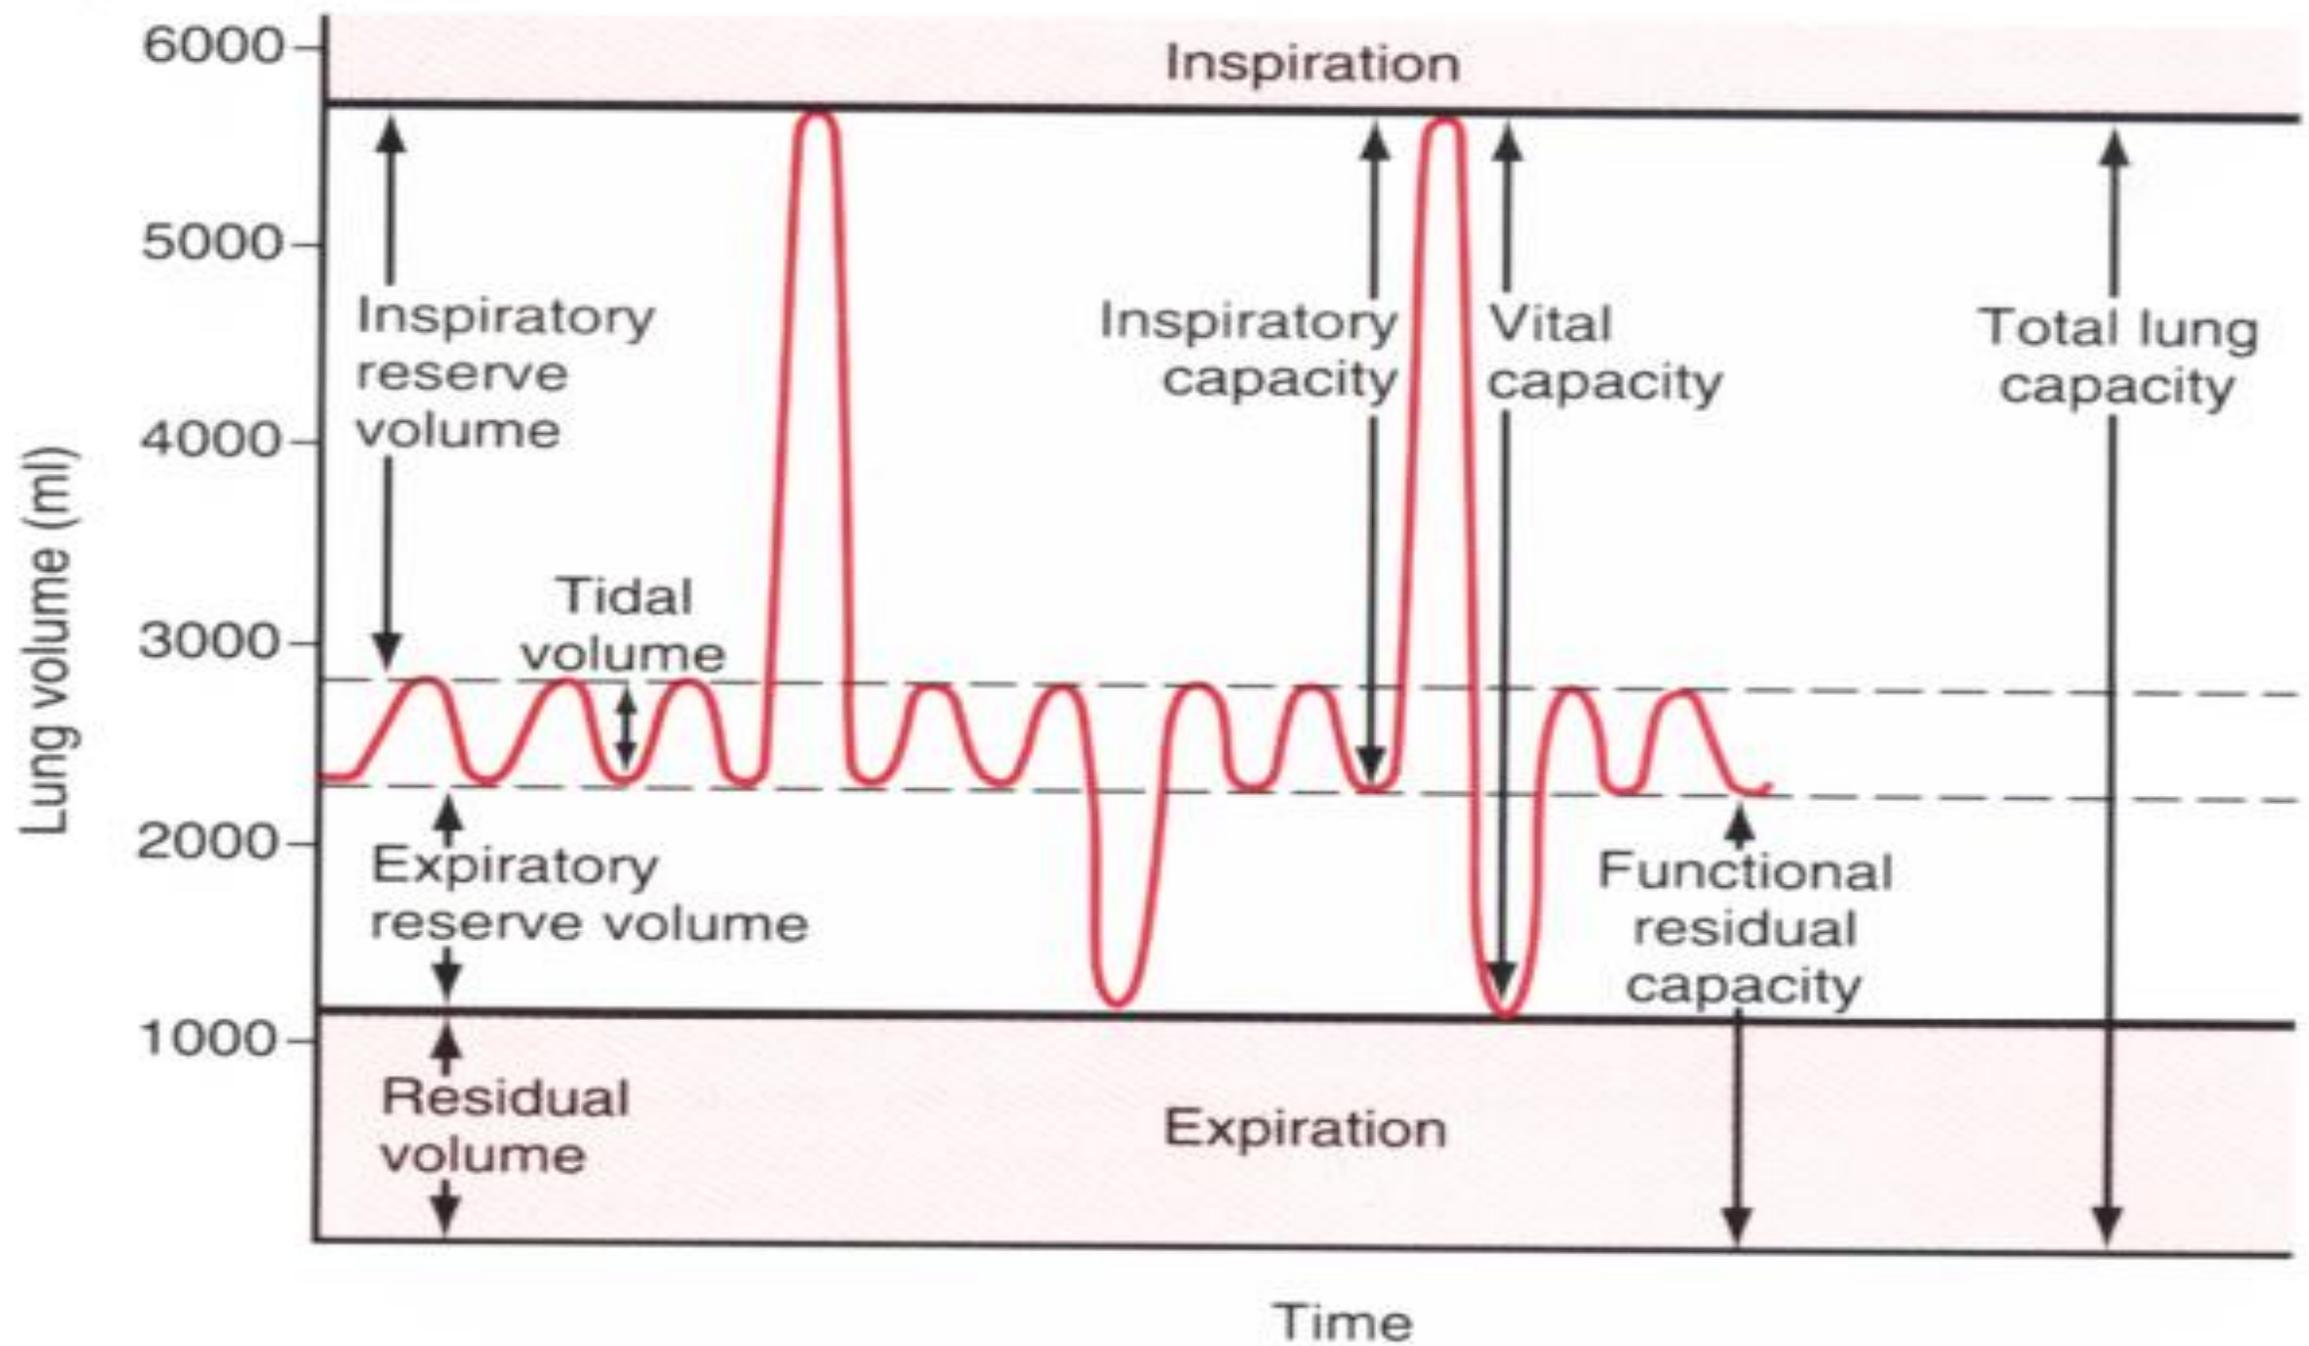

## Spirogram

- It is the record of lung volumes and capacities

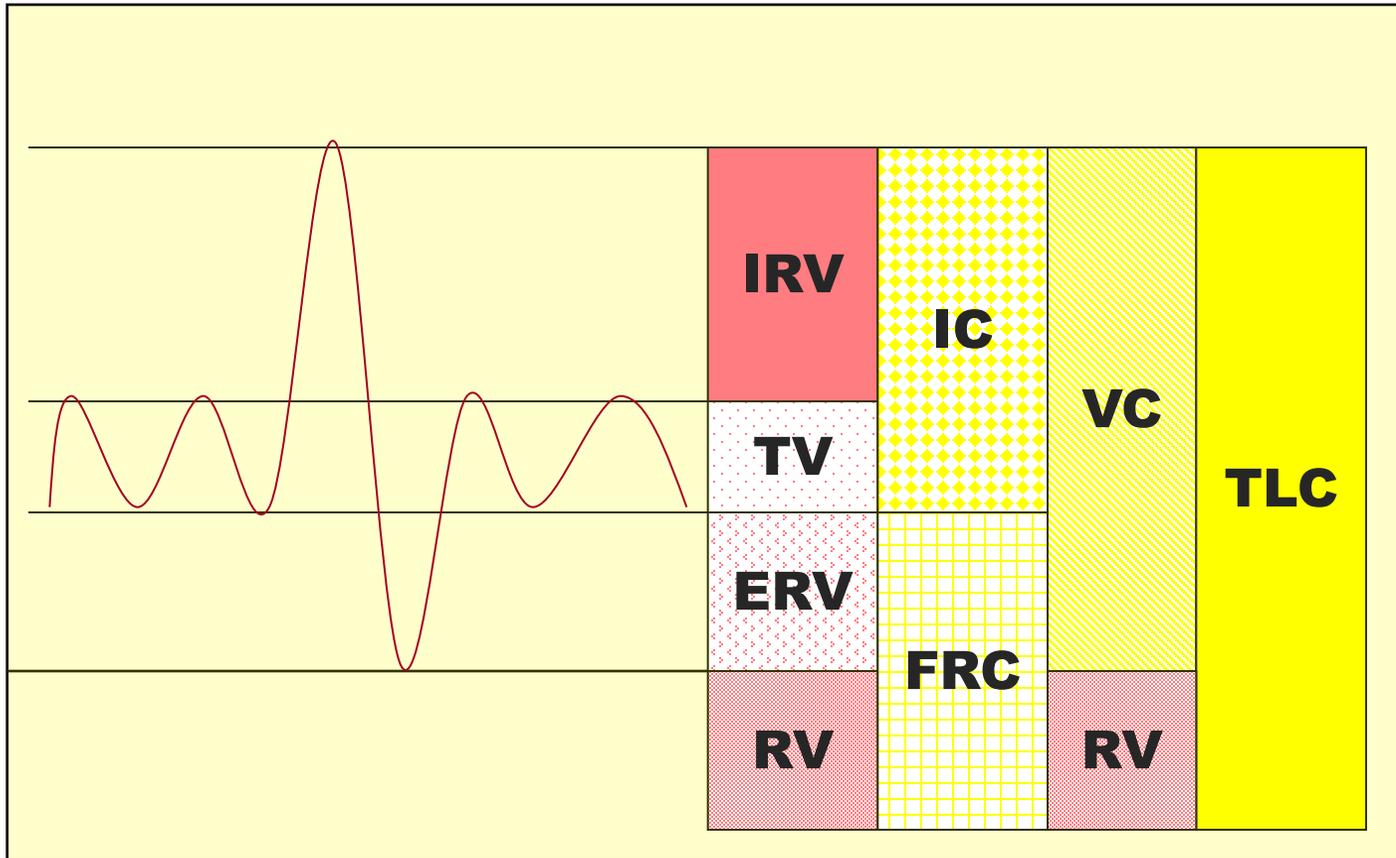

☐ **4 Volumes**

☐ **5 Capacities;** Sum of 2 or more lung volumes

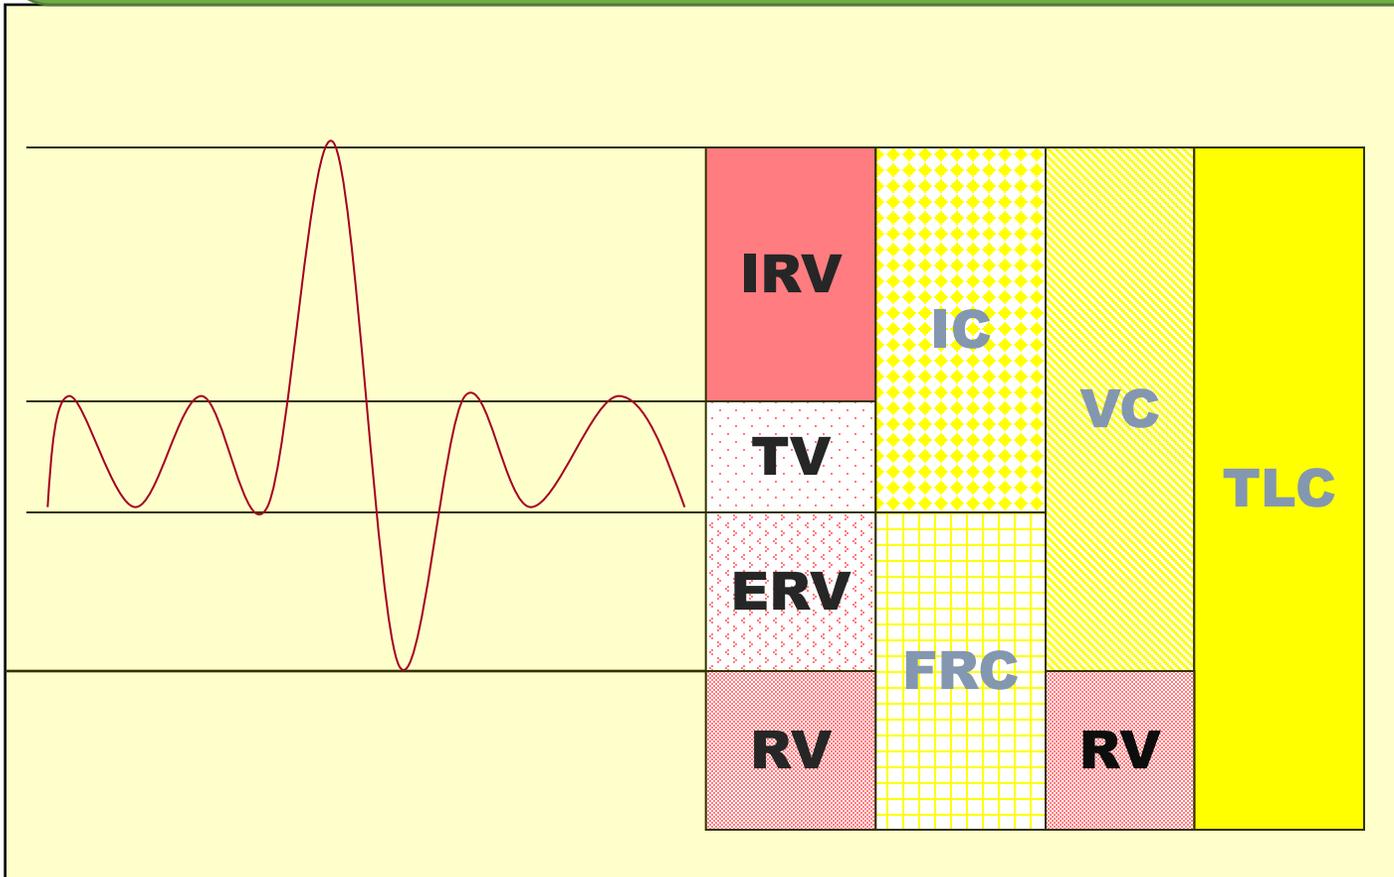

# Tidal Volume (TV)

- Volume of air that can be inspired or expired during normal quiet breathing.

- Value: 500 ml

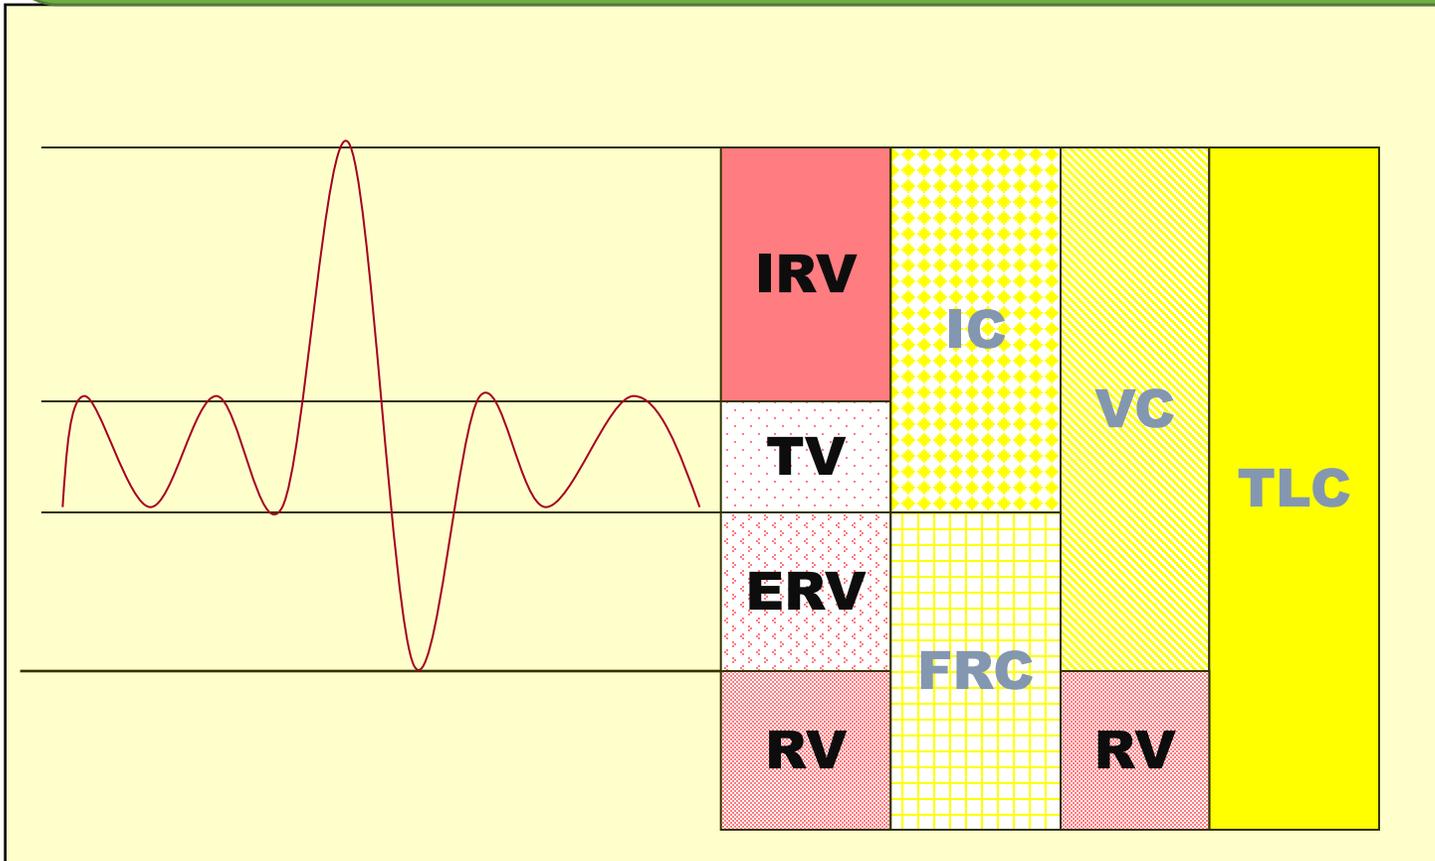

# Inspiratory Reserve Volume (IRV)

- The maximum amount of air that can be inspired by forced inspiration after the end of normal inspiration

- Value: 3000 ml

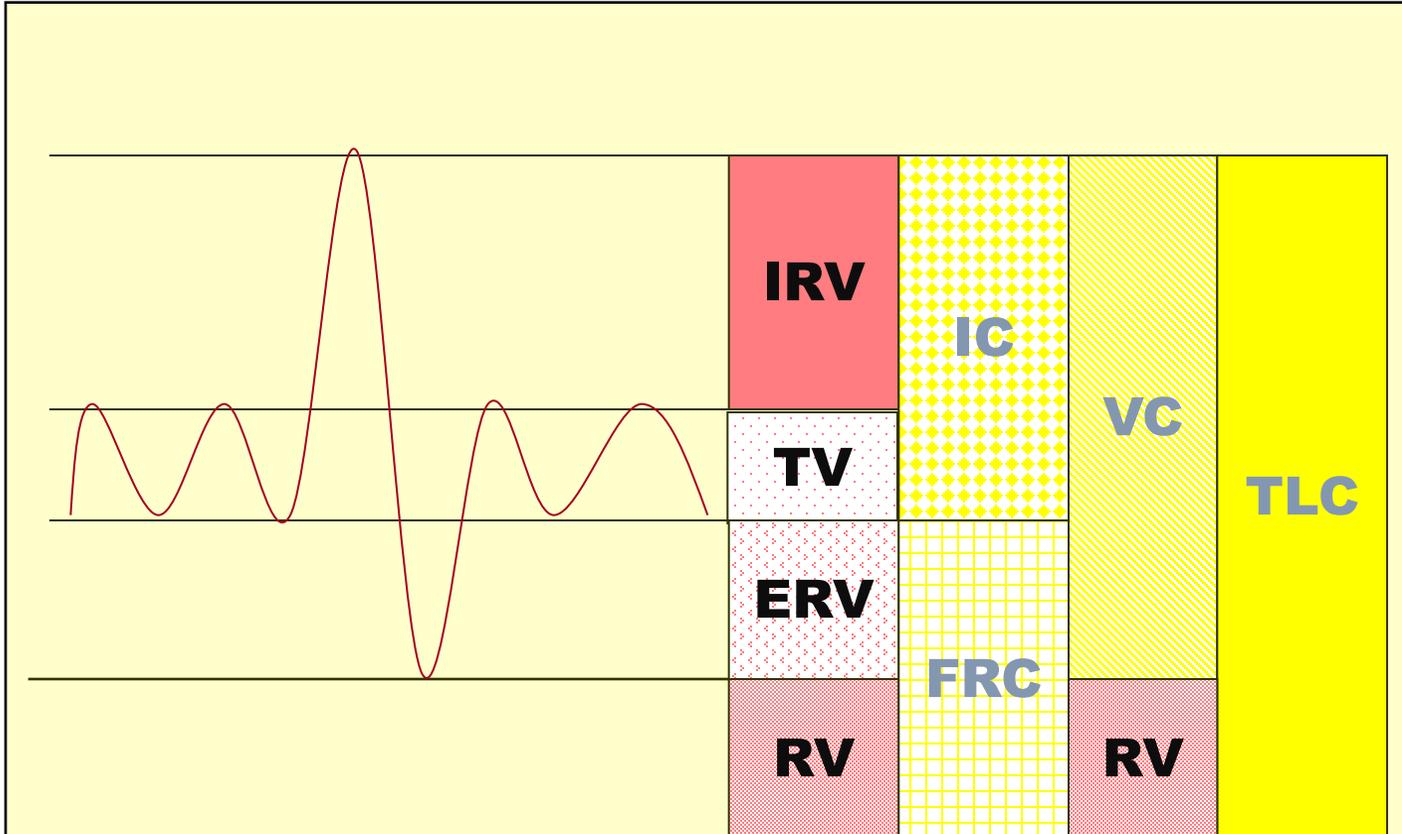

# Expiratory Reserve Volume (ERV)

- Maximum amount of air that can be expired by forced expiration after the end of normal expiration.

- **Value:** 1000 ml

# Residual Volume (RV)

- Volume of air remaining in the lungs after the end of forced expiration
- **Value:** 1200 ml

# Residual volume

➤ **Definition:** It is the volume of air that remains in the lung after forced expiration. It is about 1200 ml.

➤ **This air leaves the lung only after opening the chest.**

➤ **Significance :**

1. aerate blood between breathes → prevents marked changes in blood gases.

2. The ratio of RV/TLC is important clinically =25-30%.

• ↑ in conditions with difficult expiration as in: **bronchial asthma and emphysema.**

➤ **Measurement:** Helium dilution method.

# *Minimal air*

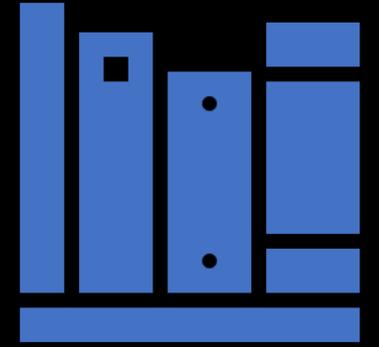

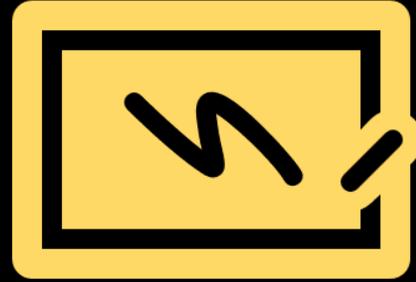

\* \*It is the volume of air remaining in the lungs after opening the chest and expelling the residual volume.

\*It is the air that enters the lung with the first breath it has a Medicolegal Importance to determine whether the newborn was born live or dead.

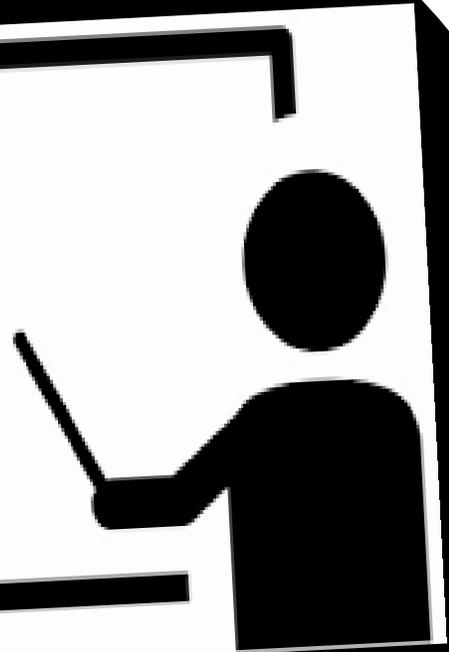

\*If a piece of lung floats, minimal air is present → the infant respire then died.

\*If it does not float → infant born dead.

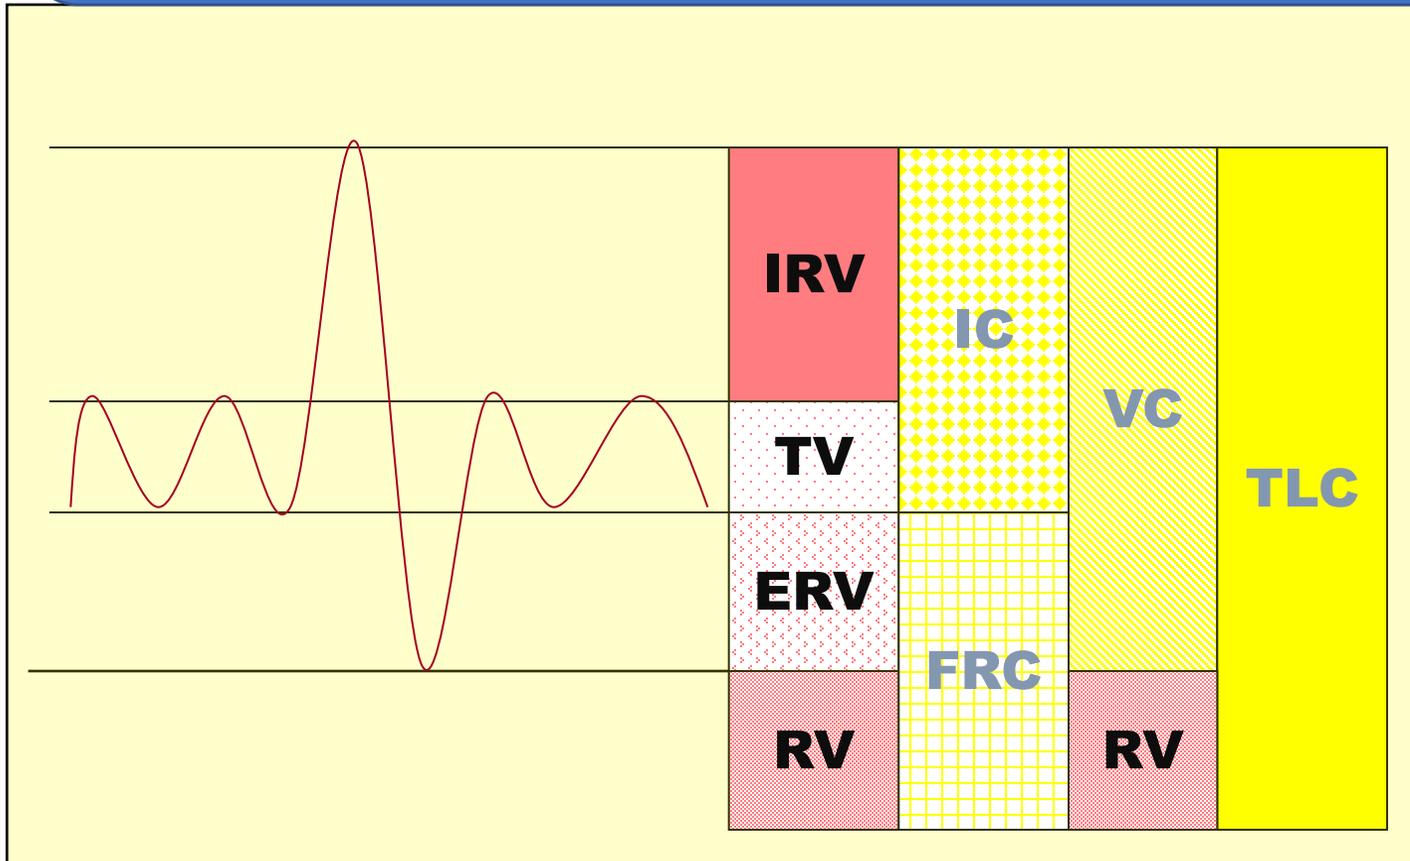

**Lung Capacities  
(sum of 2 or more lung  
volumes)**

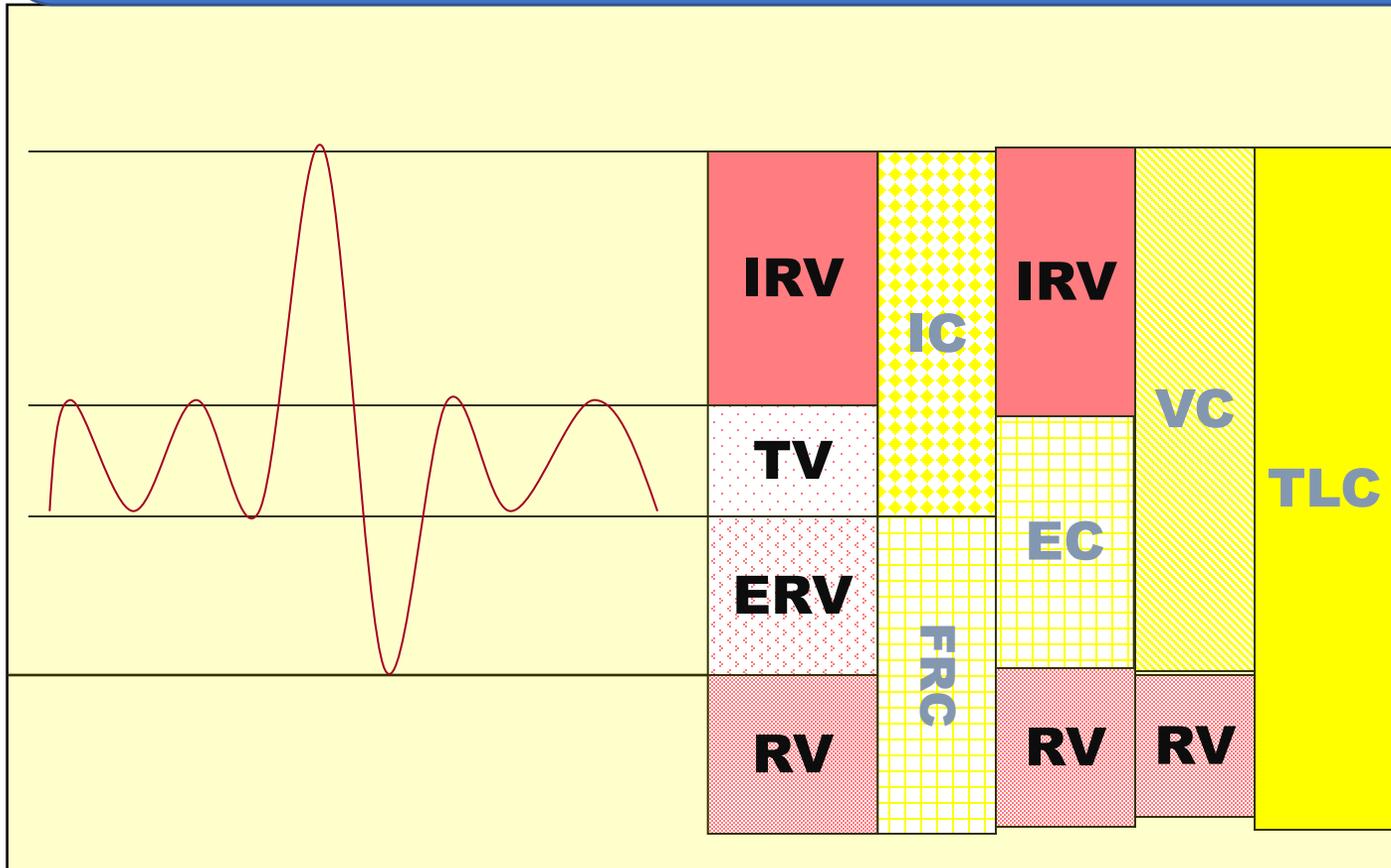

# Inspiratory Capacity (IC)

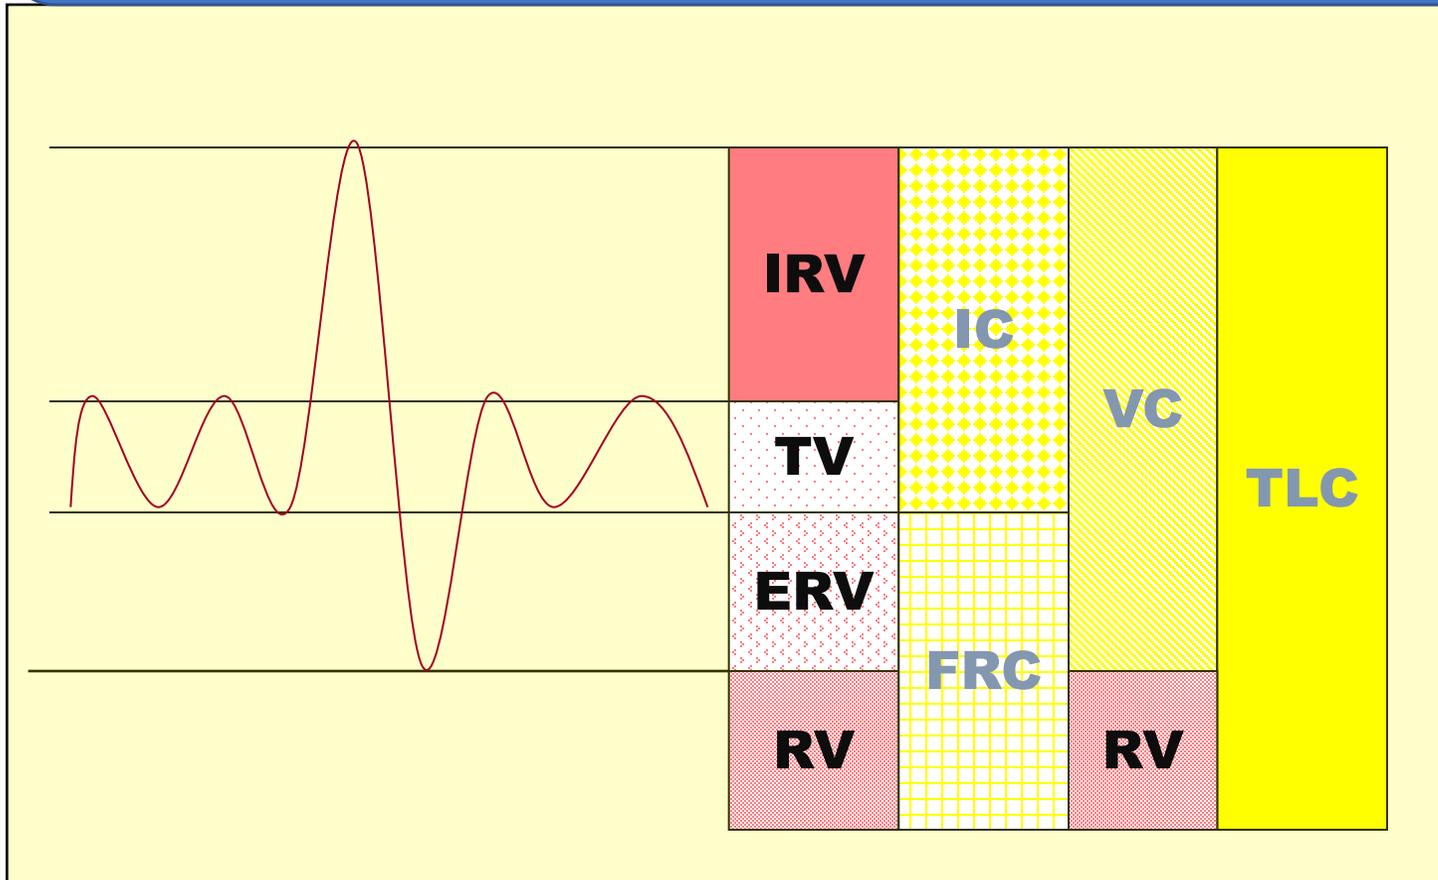

- Maximum amount of air that can be inspired by forced inspiration after the end of normal expiration.
- $IC = IRV + TV$
- **Value:** 3500 ml

# Expiratory Capacity (EC)

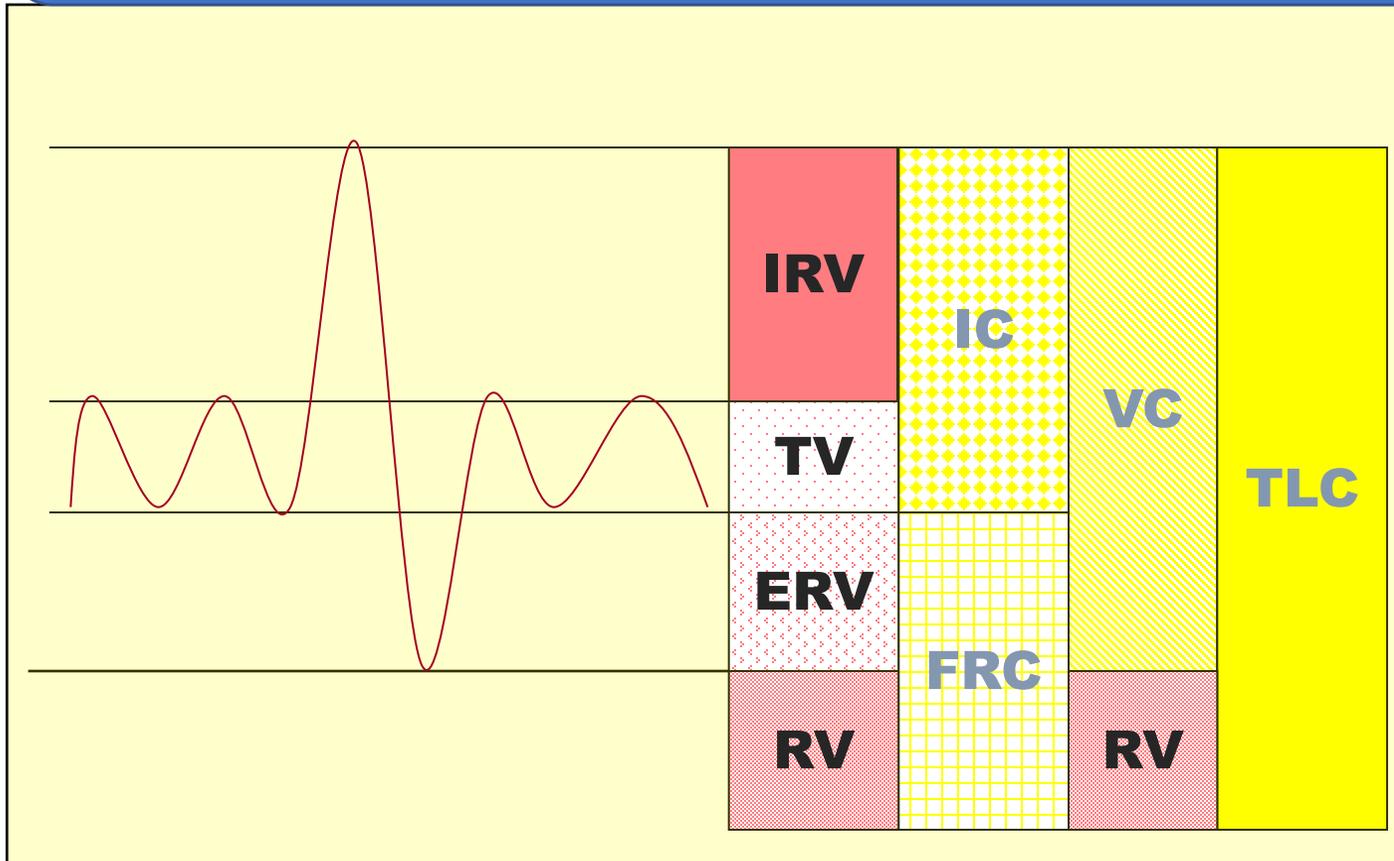

- Maximum amount of air that can be expired by forced expiration after the end of normal inspiration.
- $EC = ERV + TV$
- **Value:** 1500 ml

# Vital Capacity (VC)

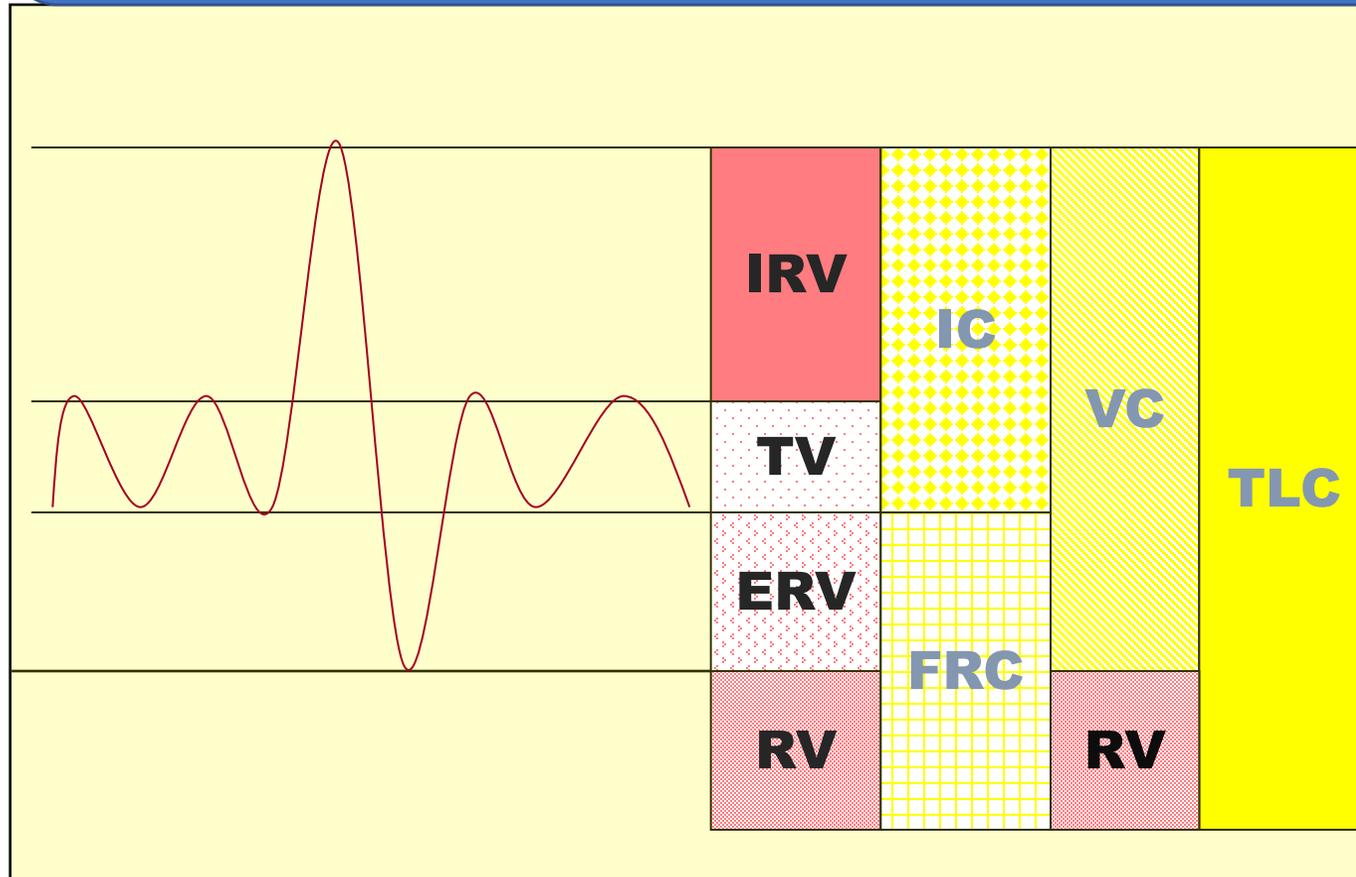

- Volume of air that can be expired by forced expiration after forced inspiration.
- $VC = IRV + TV + ERV$
- **Value:** 4500 ml

# Functional Residual Capacity (FRC)

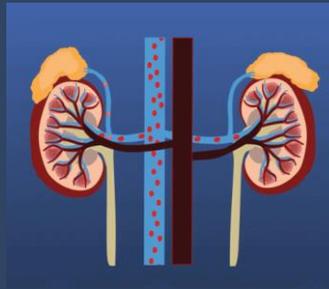

- Volume of air that can be remaining in the lung after normal expiration.
- $FRC = ERV + RV$
- **Value:** 2200 ml

# Total Lung Capacity (TLC)

- Volume of air remaining in the lungs after a maximum inspiration.
- $TLC = IRV + TV + ERV + RV$
- **Value: 5700 ml**

# Renal function

Tests -1-

# Renal Function Tests

1- Tests depending upon urine analysis.

2- Tests depending upon blood analysis.

3- Tests depending upon analysis of both blood and urine.

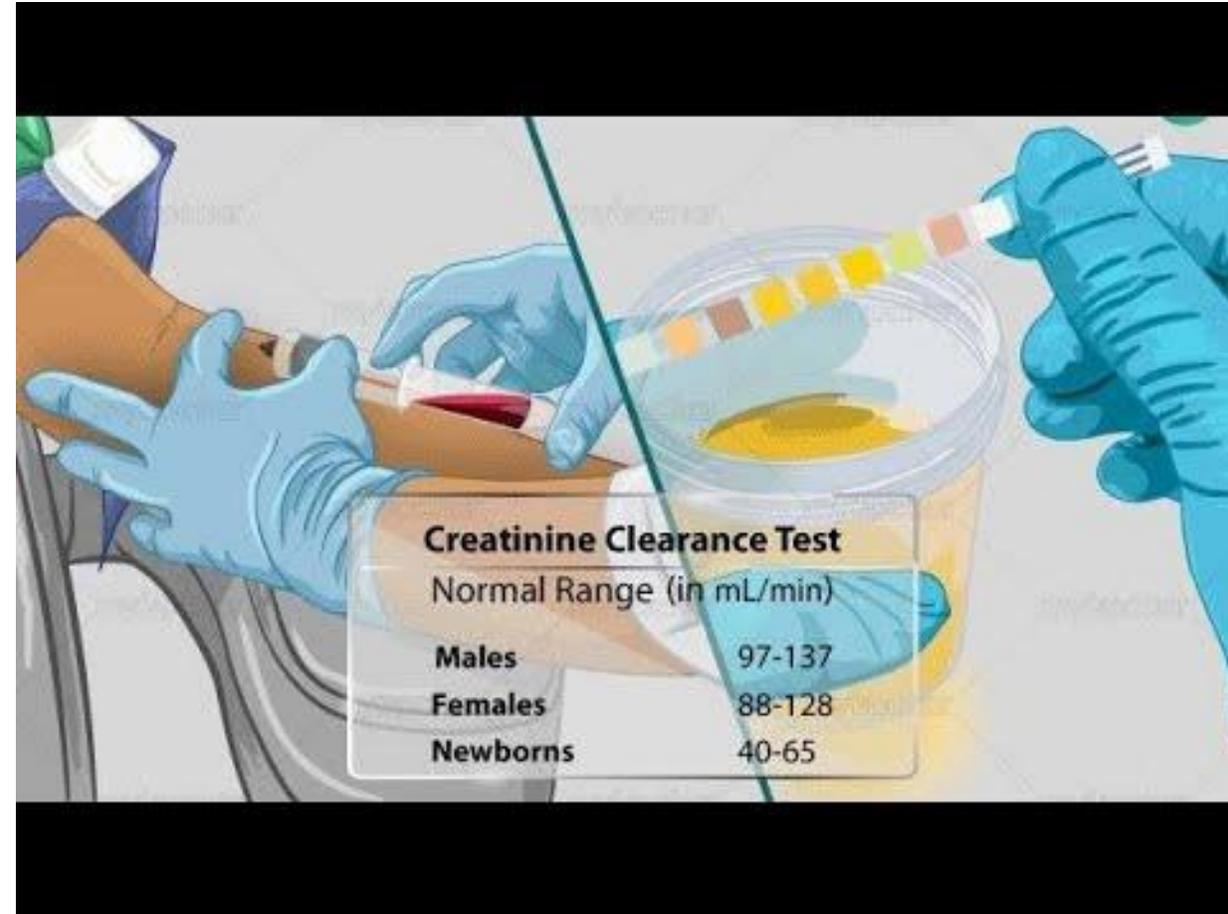

4- Radiological tests

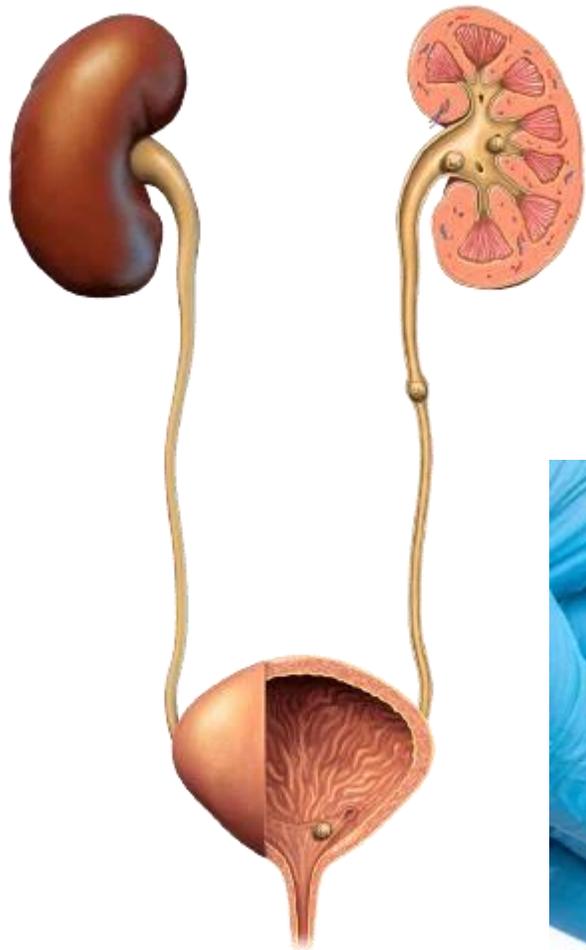

# (C) combined urine & blood tests: (clearance tests)

## Clearance tests Significance

- These tests become abnormal at the **early stages** of renal failure
- Determine the **degree** of renal dysfunction.
- **Non-invasive.**

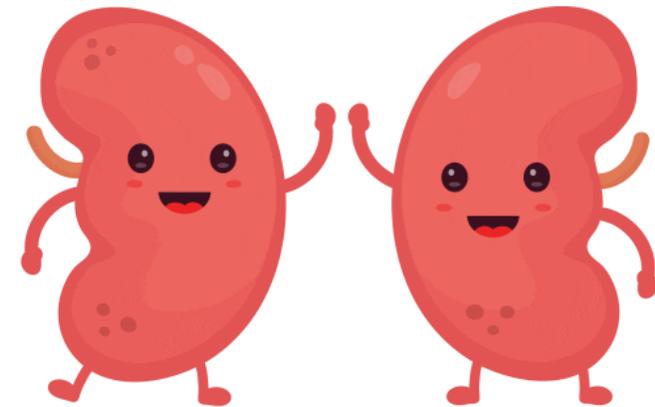

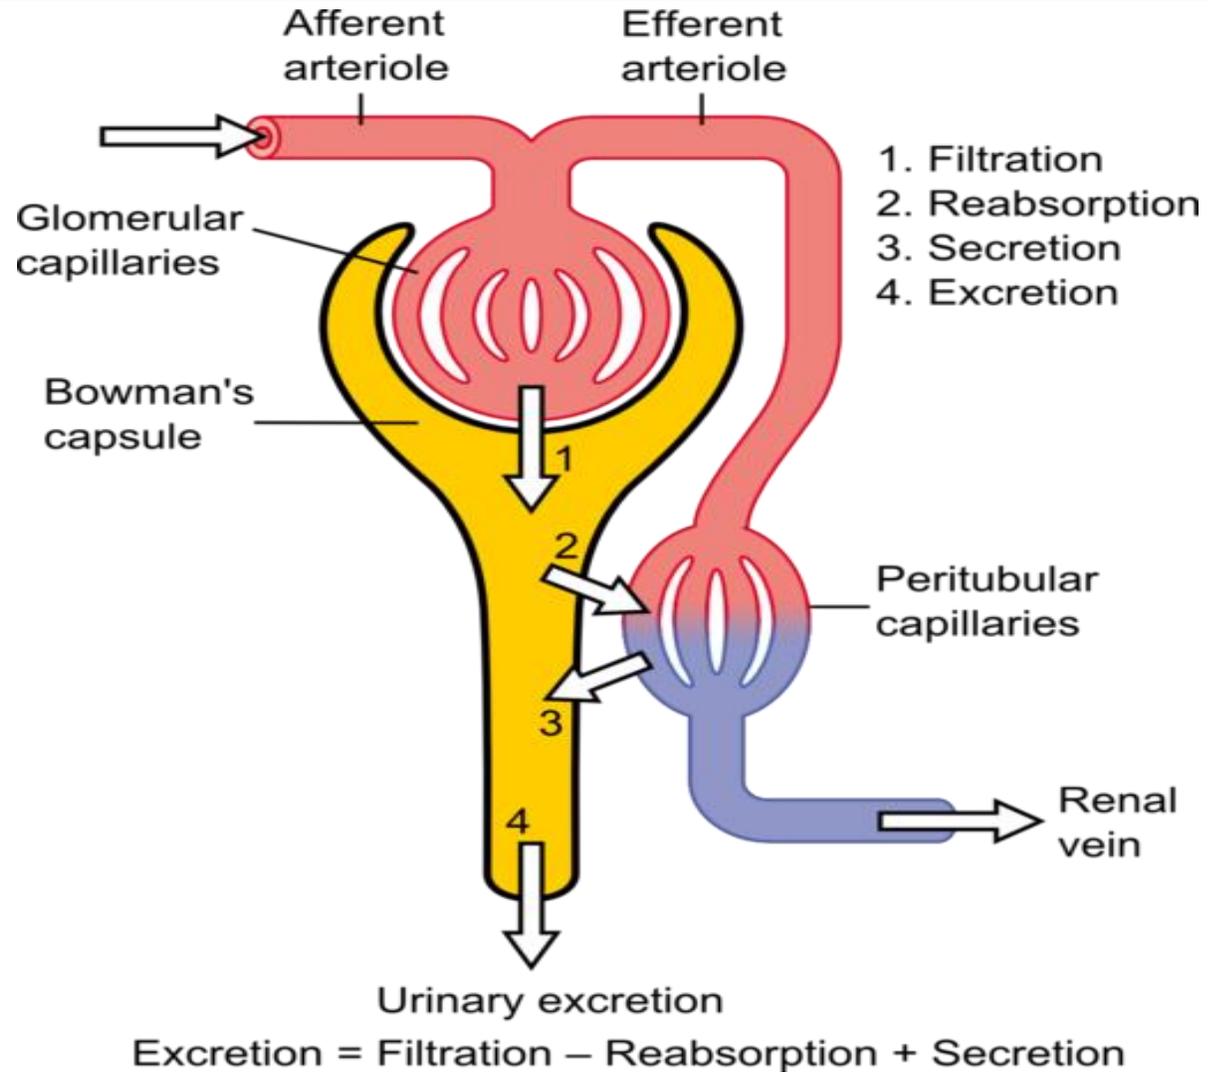

# Combined urine & blood tests:

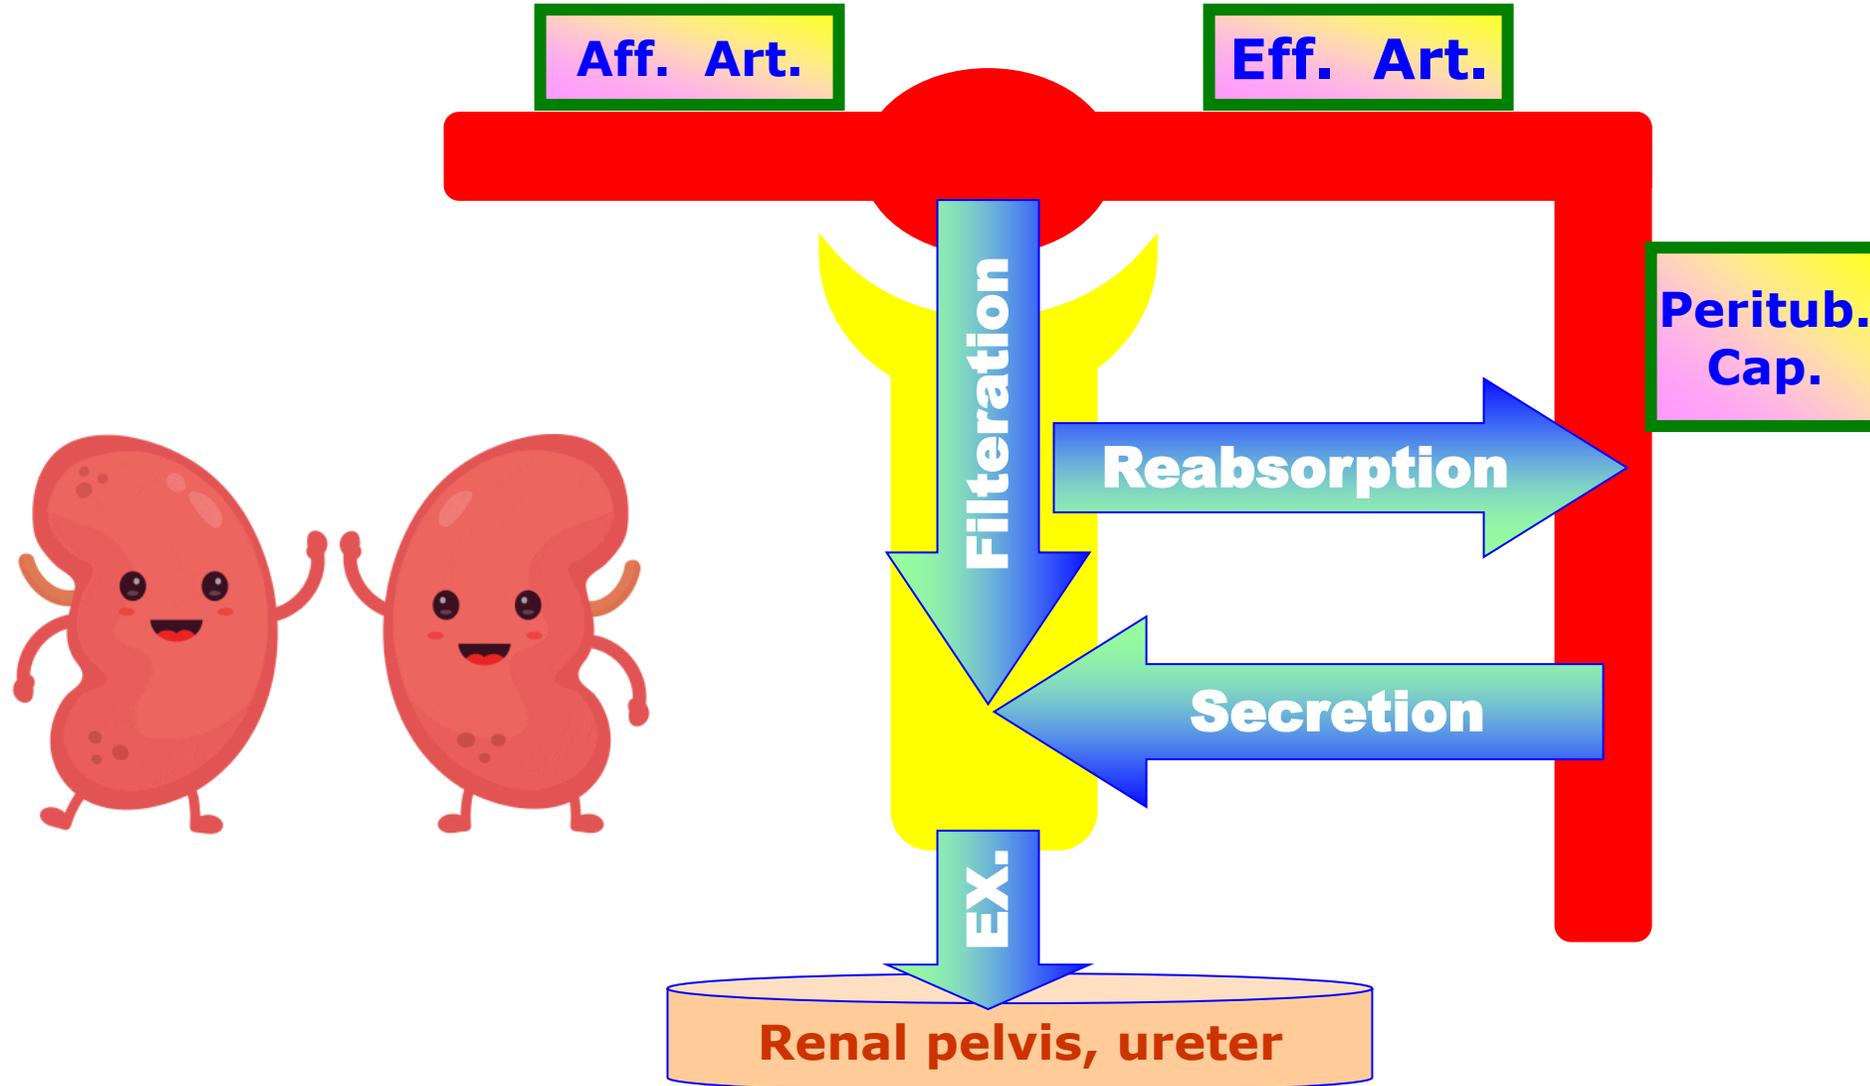

## Renal clearance

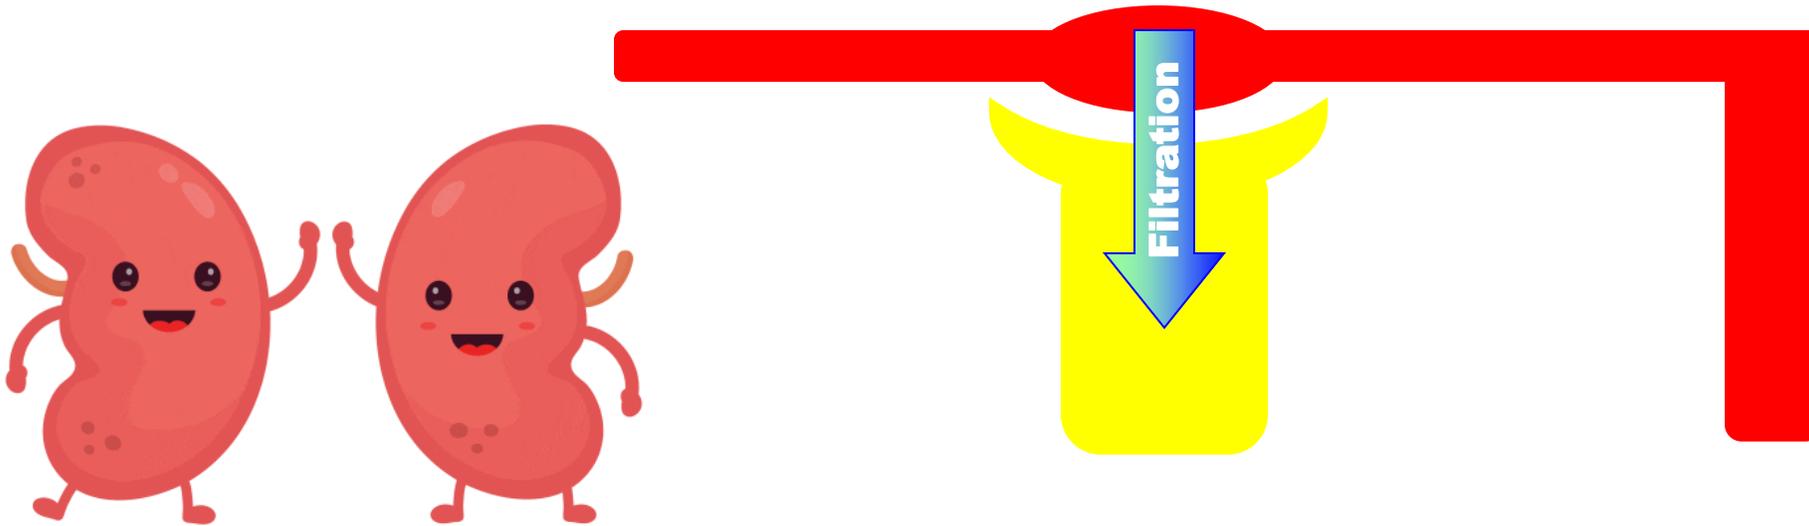

# Kidney function

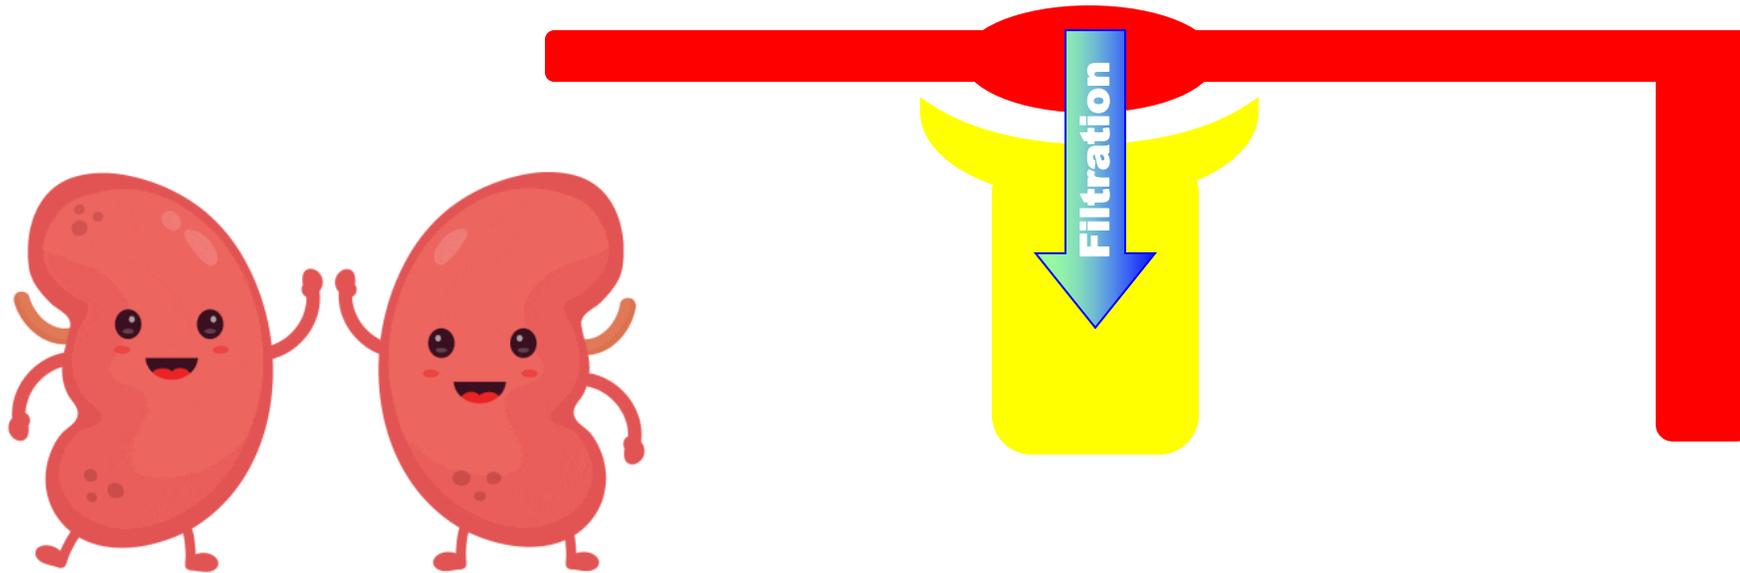

**Urinary excretion = Glomerular filtration – Tubular reabsorption + Tubular secretion**

# Glomerular Filtration Rate (GFR)

**Glomerular Filtration Rate (GFR) :**  
**volume** of plasma filtered by both kidney per unit time.  
( $\text{ml}/\text{min}$ )

# Filtered load (amount)

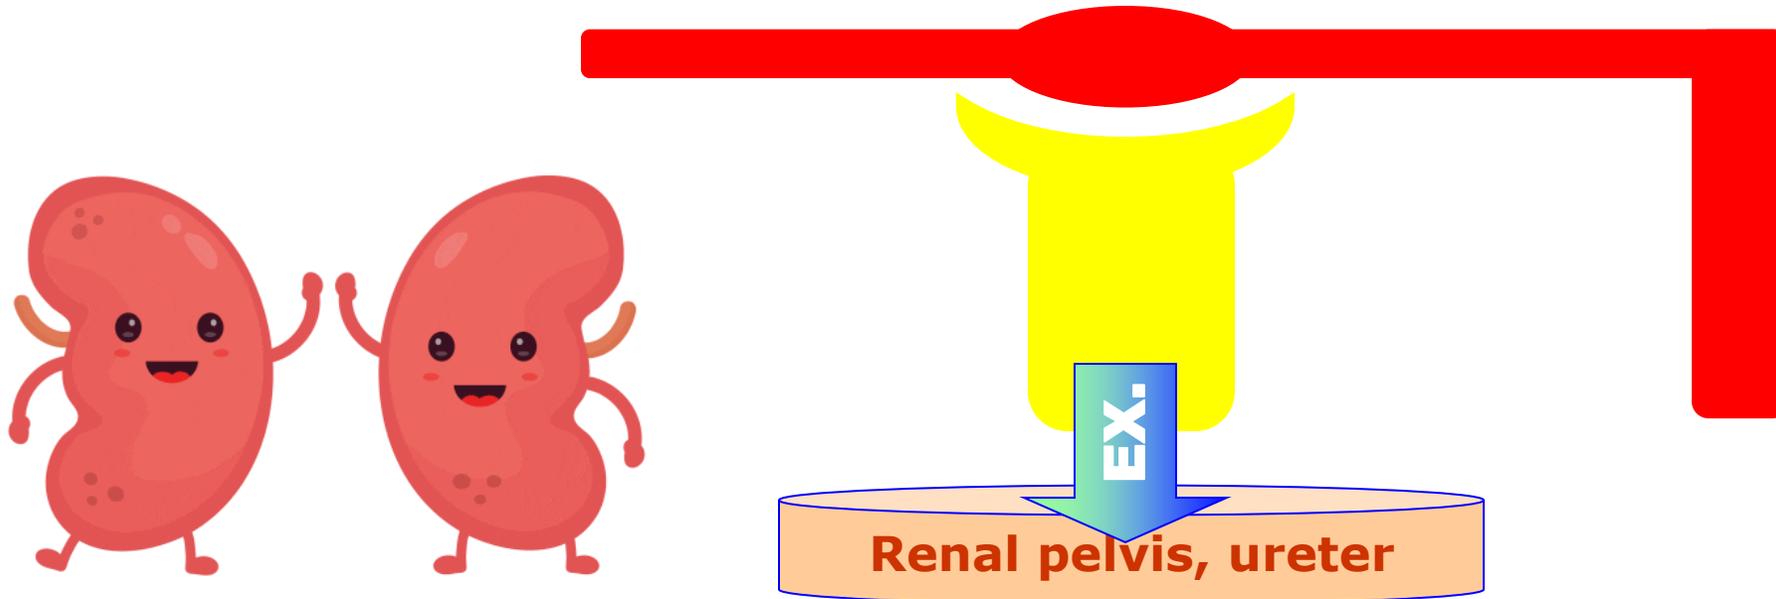

**Filtered load:**

The **amount** of substance filtered in Bowman's space in unit time (mg/min)

$$= \text{GFR} \times P_x$$

# Excretion rate (amount)

**Excretion rate:**

it is the **amount** of substance excreted in urine / min  
volume (urine) x concentration

$$V^0 \times U_x$$

**excreted amount =  
filtered amount**

→ substance is **not reabsorbed  
nor secreted** as creatinine or inulin

**excreted amount  
<  
filtered amount**

→ substance is **partially reabsorbed**  
as urea.

**excreted amount >  
filtered amount**

→ substance is **secreted** as PAHA.

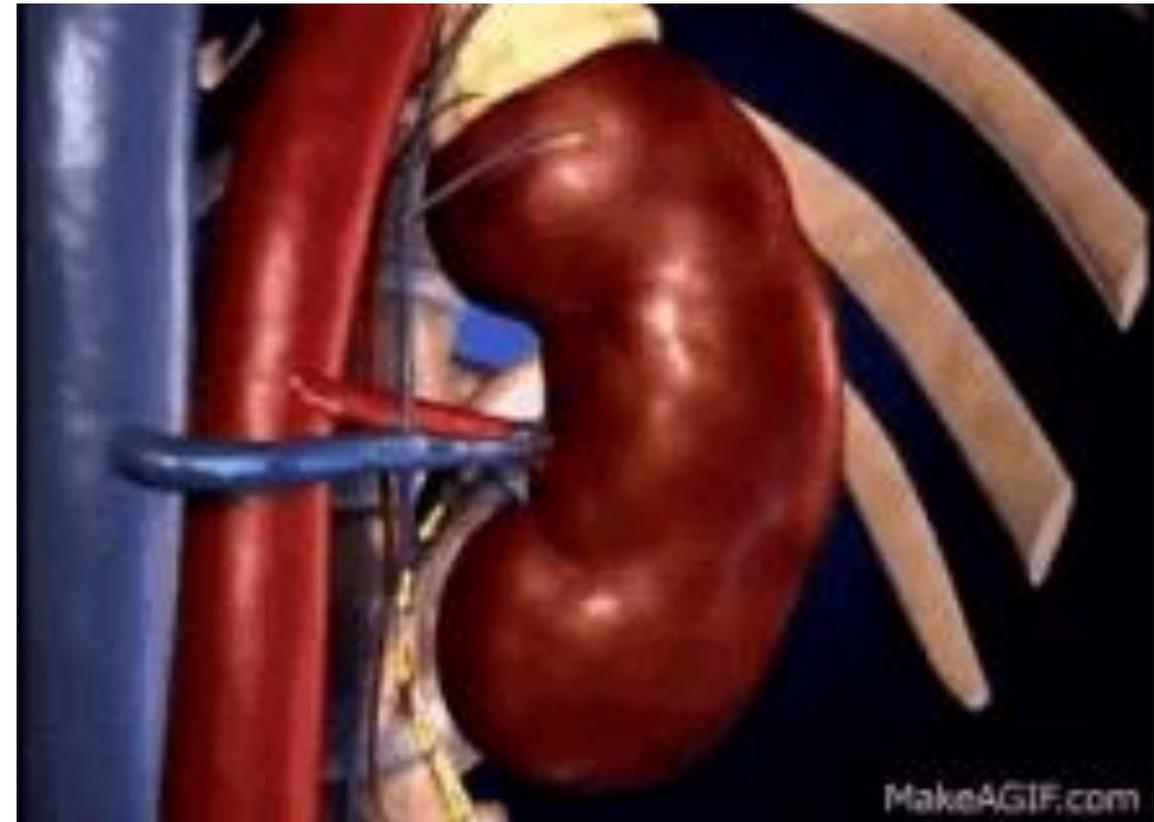

# Plasma Clearance

**Clearance of a certain substance**

**Definition:  $(C \times)$**

the **volume** of plasma cleared from this substance per unit time (minute).

**Units:** ml/min or liter/day.

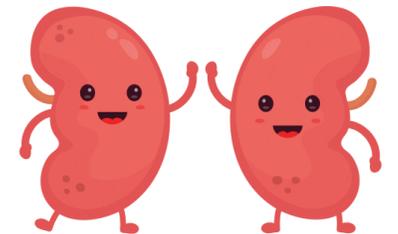

# Plasma Clearance

$$CX \text{ (Clearance of sub. x)} = \frac{U_x \cdot V^o}{P_x}$$

This means that

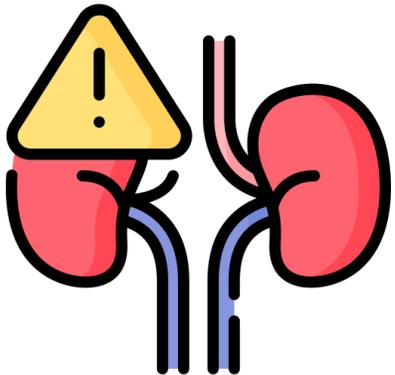

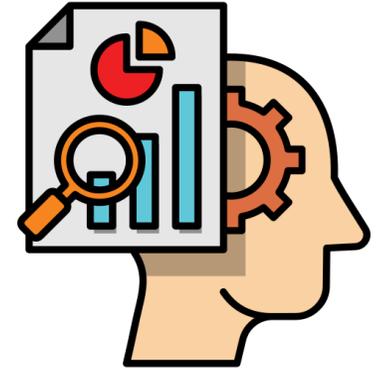

$CX =$  Excretion rate of substance  
plasma concentration of this substance

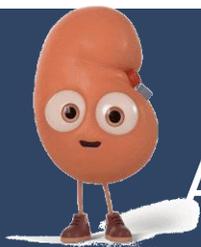

# Plasma Clearance

## Example:

If plasma  $[\text{Na}^+] = 140$  m.Eq/L.  
Urinary  $[\text{Na}^+] = 700$  m.Eq/L.  
Urine flow rate  $v^{\circ} = 1$  ml/min.

What is the clearance of  $\text{Na}^+$ ?

# Uses of clearance as a renal function test:

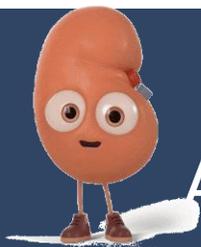

According to substance selected; clearance may be used for:

## Glomerular filtration rate (GFR):

- Clearance of inulin or creatinine.

## Renal plasma flow (RPF):

- Clearance of PAH.

# Uses of clearance as a renal function test:

According to substance selected; clearance may be used for:

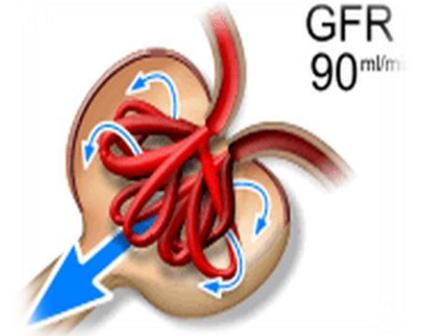

Mode of handling of substance by the kidney:

- Clearance ratio and fraction excretion.

Reabsorptive capacity of renal tubules:

- Transport maximum of glucose (TMG).

# 1- Measurement Of GFR:

Substance used to measure  
GFR should be

Non-  
toxic

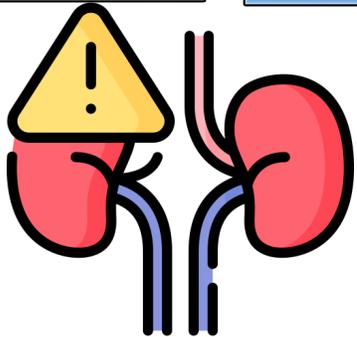

not affect  
GFR or  
RPF.

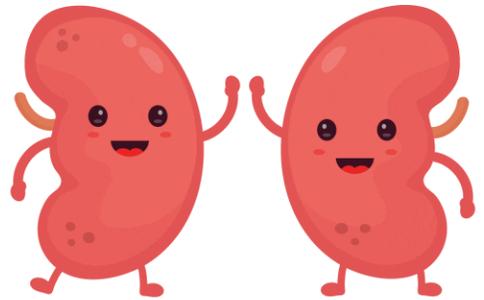

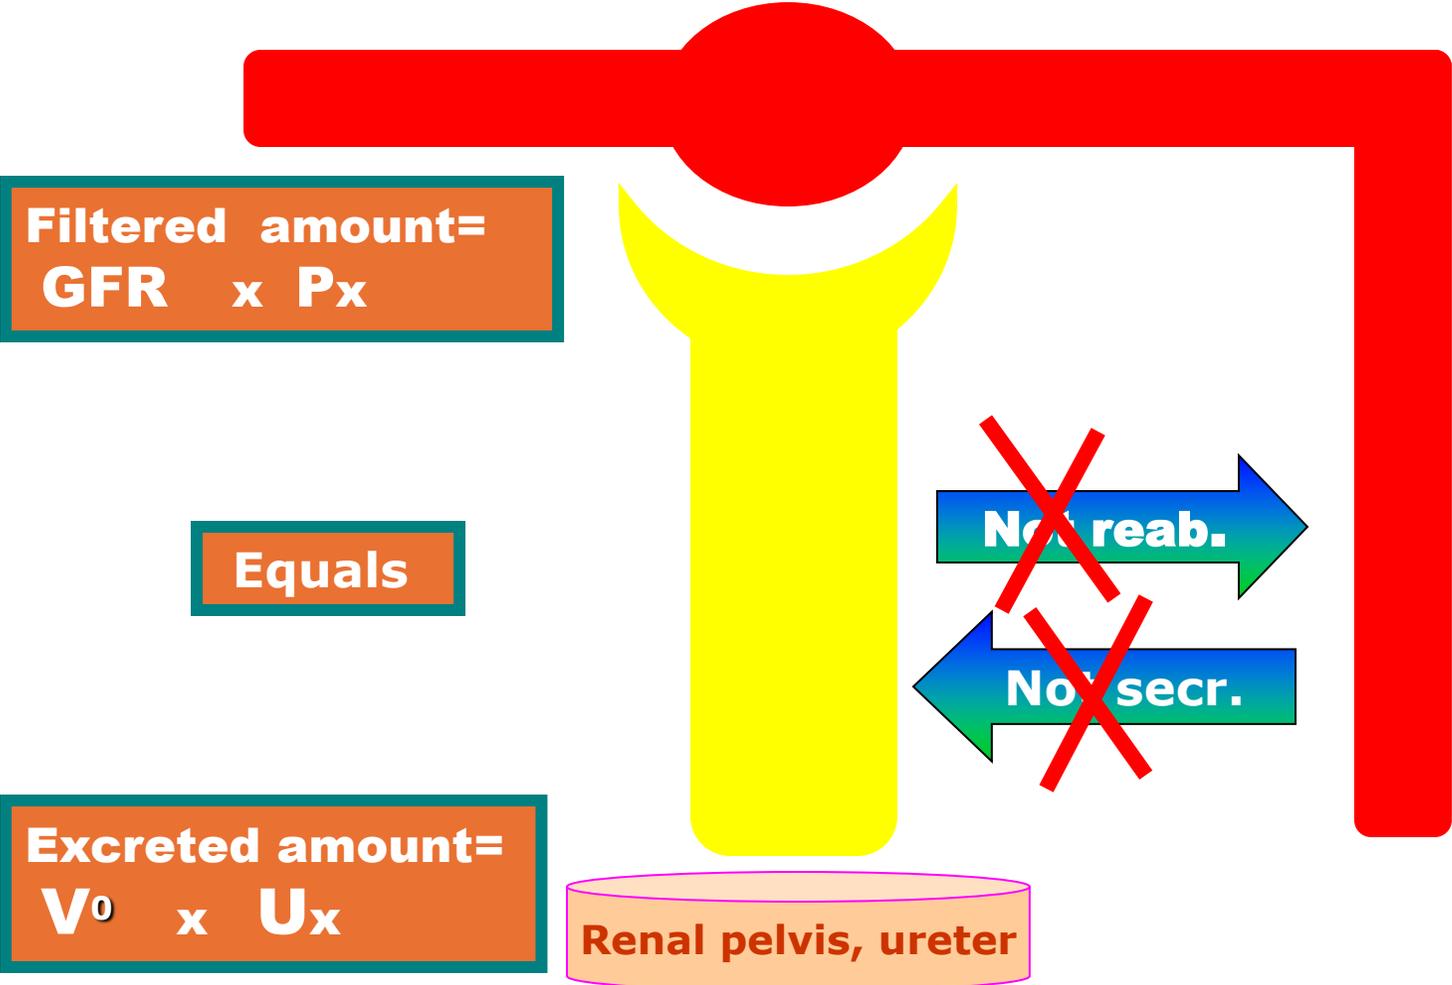

Not  
metabolized  
by the body  
or the kidney.

Freely filtered  
(small molecular  
weight and not  
bound to plasma  
proteins)

Neither  
reabsorbed  
nor  
secreted.

Accurately  
measured in  
plasma and  
urine.

# 1- Measurement Of GFR:

This sub. isn't secreted nor reabsorbed so that:

The amount of sub. **filtered** / min = The amount of sub. **excreted** / min.

The volume filtered /min (GFR) x conc. Of sub. In filtrate (  $P_X$  )  
=  
The volume of urine/min ( $V_O$ ) x conc. Of sub . in urine ( $U_X$ )

$$GFR \times P_{in} = V^o \times U_{in}$$

$$GFR = \frac{U_{in} \cdot V^o}{P_{in}} = C_{in}$$

# Two Substances Can Be Used For GFR

## 1- Inulin (Exogenous):

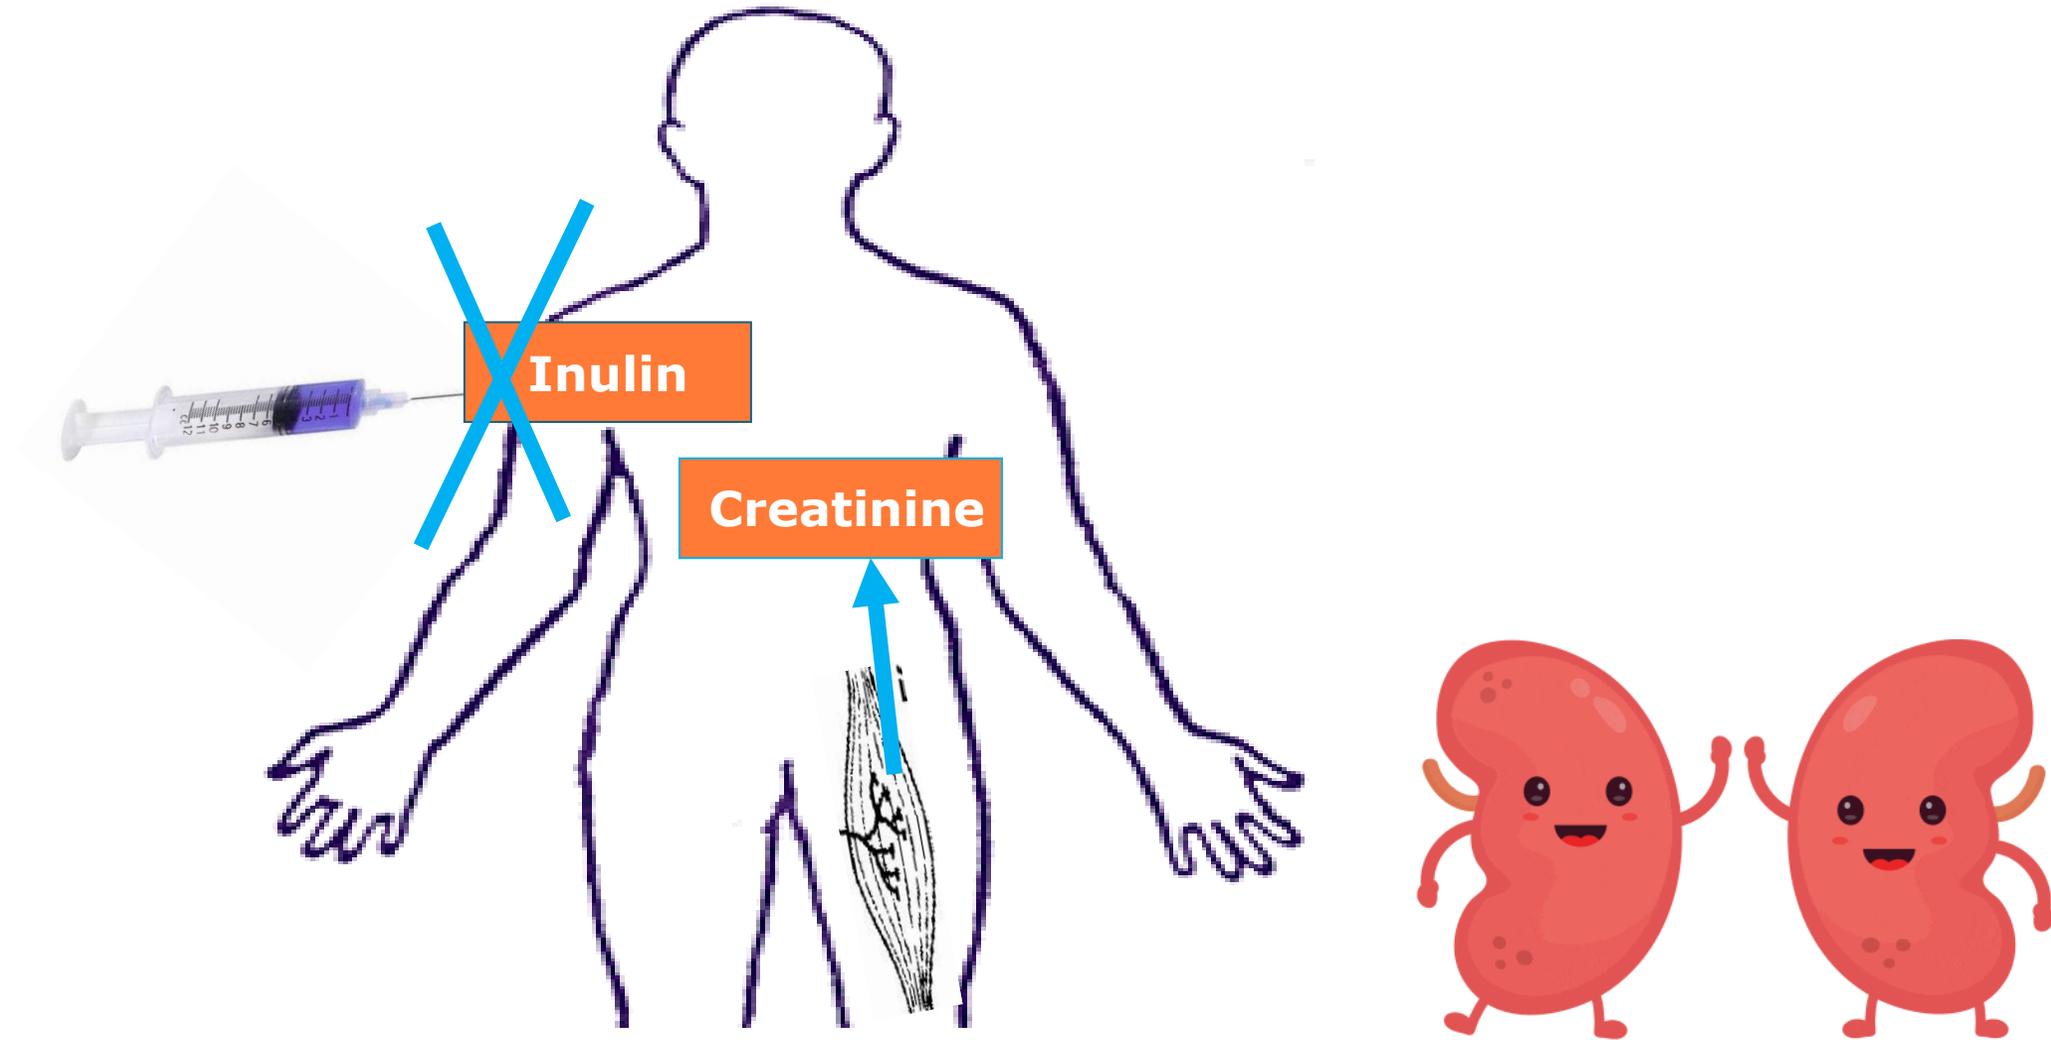

- Polymer of fructose.
- Given by intravenous drip
- $GFR = C_{in} = 125 \text{ ml./min.}$
- **Advantage: accurate** hence it is used for experimental studies.
- **Disadvantage: Exogenous**

## 2- Creatinine (Endogenous):

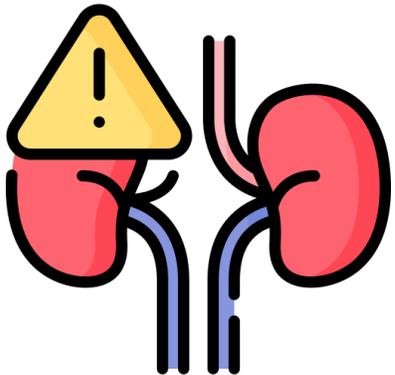

- End product of creatine metabolism in skeletal muscles.
- $GFR = C_{Cr} = 140 \text{ ml /min.}$
- **Advantage: Endogenous.** Its plasma concentration is constant over 24 hours.
- **Disadvantage:** slightly secreted so GFR measured by this method is 10% higher than GFR measured by inulin clearance.

# Endogenous creatinine instead of exogenous inulin

# GFR

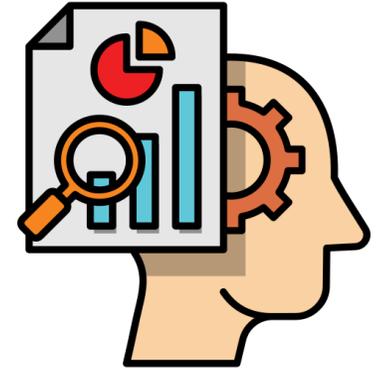

Example:

Example:

$$P_{cr} = 0.02 \text{ mg/ml.}$$
$$V^0 = 1.25 \text{ ml/min}$$
$$U_{cr} = 2 \text{ mg/ml}$$

What Is The GFR ?

## 2- Measurement Of renal blood flow (RBF):

Substance used to measure RBF should be

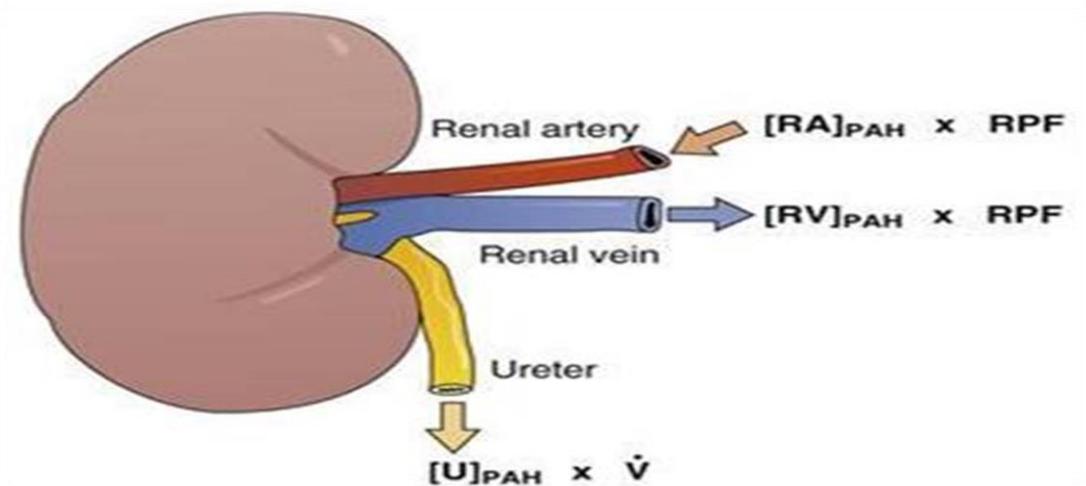

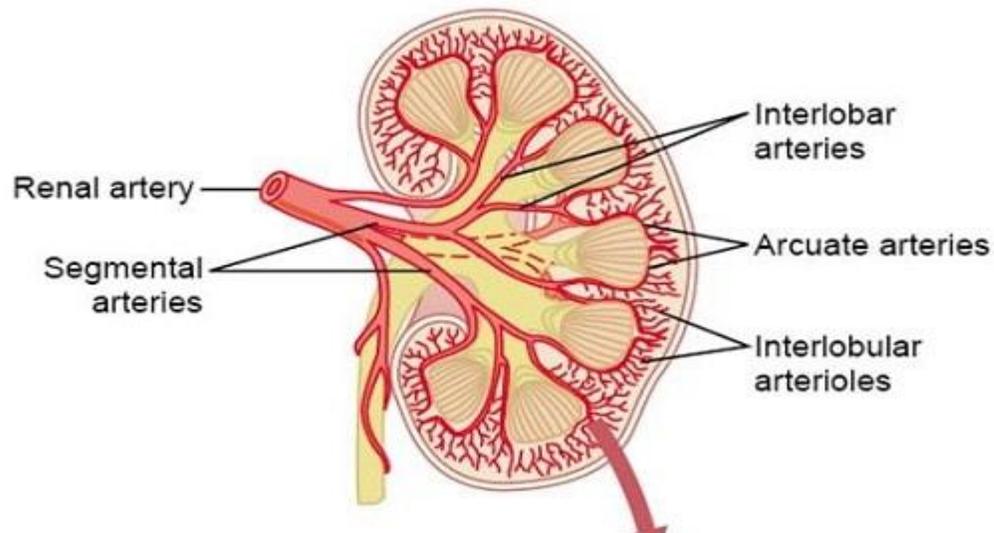

Non-toxic.

Does not affect  
GFR or RPF

Completely  
secreted

Not  
reabsorbed.

Accurately measured  
in plasma and urine.

## 2- Measurement Of RBF:

The amount of PAHA **cleared** \ min = The amount of PAHA **excreted** \ min.

The **volume** of plasma x **conc.** of PAH in plasma = the **volume** of urine x **conc.** of PAH in urine

$$\text{RPF (renal plasma flow)} \times P_{\text{PAH}} = U_{\text{PAH}} \times V^0$$

$$\text{RPF} = \frac{U_{\text{PAH}} \times V^0}{P_{\text{PAH}}} = C_{\text{PAH}}$$
